### **Certification of Authorship**

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the reference section of the thesis.

### **Report of Research Committee**

Ms. Bandana Karki has defended research proposal entitle “**Determinants of Capital Structure of Nepalese Commercial Banks**” successfully. The research committee has registered the dissertation for further progress. It is recommended to carry out the work as per suggestions and guidance of supervisor Asso. Prof. Gyan Mani Adhikari and submit the thesis for evaluation and viva voce examination.

Asso. Prof. Gyan Mani Adhikari  
Thesis Supervisor

**Dissertation Proposal Defended**  
Date: January 26, 2021

-----  
Asso. Prof. Gyan Mani Adhikari  
Thesis Supervisor

**Dissertation Submitted Date:**  
November 17, 2021

-----  
Prof. Dr. Mahananda Chalise  
Chairperson, Research Committee

**Dissertation Viva Voce Date:**  
November 23, 2021

## Approval Sheet

We have examined the dissertation entitled “**Determinants of Capital Structure of Nepalese Commercial Banks**” Presented by Ms. **Bandana Karki** for the degree of **Master of Business Studies (MBS)**. We hereby certify that the dissertation is acceptable for the award of degree.

-----  
Asso. Prof. Gyan Mani Adhikari  
Thesis Supervisor

-----  
Asst. Prof. Achut Gyanwali  
Internal Examiner

-----  
Lect.Mr.Santosh Kumar Ghimire  
External Examiner

-----  
Prof. Dr. Mahananda Chalise  
Chairperson, Research Committee

.....  
Prof. Dr. RamjiGautam  
Head of Department

Date:

## Acknowledgment

This study entitled **Determinants of Capital Structure of Nepalese Commercial Banks** has been conducted for the partial requirements for the degree of **Masters of Business Studies (MBS)** of Tribhuvan University. Every project whether it will be big or small it will become successful mainly due to the effort of wonderful people who have always their valuable advice. I sincerely appreciate the inspiration; support and guidance of all those people who have been instrumental in making this study a success.

I would like to extend my immense gratitude to my supervisor Asso. Prof. Gyan Mani Adhakari for his valuable supervision and professional advice and encouragement during the research work. I am highly indebted and very thankful for their continuous support and constructive suggestions that have enabled this research project to achieve its present form. Moreover, I am also indebted and thankful to them for their motivation, support and instruction in completing my overall MBS degree.

Special mention goes to Prof. Dr. Mahananda Chalise (Chairperson, Research Committee) for his timely and continues guidance throughout the study. He not only reviewed my work but also suggested valuable and insights. I would like to express cordial gratitude prof. Dr. Ramji Gautam (Head of Department) for his inspiration and support to complete this research work. I also highly appreciate the efforts of all teacher and other members of central department of management, libraries staffs who inspired me to complete this thesis.

Finally, I would like to appreciate all my family members and friends for their affection and emotional support that has inspired me to achieve every success including this study. I can honestly say I could not have successfully completed this work without their help and direction.

Bandana Karki

## Abstract

This study examines the determinants of capital structure in Nepalese Commercial Banks. The study is based on secondary data of four commercial banks with 40 observations for the period 2010/11 to 2019/20. The total debt to total assets and total debt to total equity were selected as dependent variables while return on assets, bank size, assets tangibility, assets growth and liquidity are the independent variables. The data were collected from annual reports of concerned sample bank. The Pearson's correlation coefficients and regression models are estimated to test the significance and impact of bank specific factors on the capital structure of Nepalese commercial banks. The result shows that banks size and assets tangibility are positively correlated with total debt to total assets whereas return on assets, assets growth are negatively correlated with total debt to total assets. Likewise return on assets, bank size, assets tangibility, assets growth is negatively correlated with total debt to total equity. It indicates that higher assets growth, return on assets over would be the total debt to total assets and total debt to total equity. Likewise, higher the bank size and assets tangibility higher would be the total debt to total assets. This study concludes that return on assets, bank size and assets tangibility are the most influencing factors and assets growth are the least influencing factor affecting the capital structure of Nepalese commercial banks. The study recommends as proper matching between assets and liabilities structure is required, banks should pay attention towards this aspect. Outside security analysts and comparative industry have only a minimal effect on the development of these targets.

**Key words:** assets growth, assets tangibility, bank size, return on assets, total debt to total assets, total debt to total equity

# CHAPTER I

## Introduction

### 1.1 Background of the studies

Capital structure is the particular combination of debt and equity used by a company to finance its overall operations and growth. Equity capital arises from ownership shares in a company and claims to its future cash flows and profits. Debt comes in the form of bond issues or loans, while equity may come in the form of common stock, preferred stock, or retained earnings. Short-term debt is also considered to be part of the capital structure.

Capital plays an important role in the business. It requires from the promotional stage up to the end of a business. No business can be operated without capital. So, capital is labeled as “Life Blood of Business.” The capital can be collected from that various sources. The various sources are shares, debentures, public deposits, bank loan etc. The financial manager has thus to make decision about the source or their combination to raise such funds. A firm employs substantial amount of debt capital because of tax deductibility of interest payment, flexibility, and lower effective cost. Capital Structure decision is one of the most important decisions that are taken by the financial manager. It is because the capital structure decision affects weighted average cost of capital (WACC), value of the firm and risk position of the firm. For maximization of profit and maximization of shareholders wealth, optimal capital structure should be maintained. Therefore, the role of optimal capital structure is more significant for every business organization irrespective to their nature.

Both debt and equity can be found on the balance sheet. Company assets, also listed on the balance sheet, are purchased with debt or equity. Capital structure can be a mixture of a company's long-term debt, short-term debt, common stock, and preferred stock. A company's proportion of short-term debt versus long-term debt is considered when analyzing its capital structure.

The term capital structure refers to the proportion of debt and equity capital. The capital structure concept has an important place in the theory of financial Management. The financing decision of a firm relates to choose of proportion of debt and equity to finance the investment requirement. A proper balance between debt and

equity is necessary to ensure a trade-off between risk and return to the shareholders. A capital structure with reasonable proportion of debt and equity capital is called optimal capital structure. However, it can be expected that the capital structure decision affects the total value of the firm should select such a financing mix. Which maximize the shareholder wealth? Optimum capital structure may define as the capital structure or combination of debt and equity that leads to the maximum value of the firm (Thapa and Gautam 2066).

A firm fulfills its financial needs using different sources of financing. These sources of financing may be long term, and short term. Short –term sources of financing mature within one year or less whereas fund raised from long-term sources of financing can be used for several years. When a firm expands its business or activity, it needs capital. The term capital denotes the long-term funds of the firm. All of the items on the liabilities side of firm’s balance sheet, excluding current liabilities, are sources of capital. The total capital can be divided into two components: debt capital and equity capital. (Western and Brigham 2003).

The total capital can be divided into two components: Debt Capital and Share Capital. The Capital Structure is made up of debt and equity securities, which comprises a firm’s finance of its assets. It is the permanent source of financing represented by long term debt, plus preferred stock, plus net worth; the determination of the degree of liquidity of a firm is no simple task. In the long-term run, liquidity may depend on the profitability of a firm but whether it services to achieve long run profitability depends to some extent on its capital structure. This term includes only long-term debt and total stockholders’ investment. It may be defined as one including both short term and long-term fund (Western and Brigham 2003).

### **Equity capital**

Equity capital consists of the long-term fund provided by the firm’s owners, the stockholders. In other words, equity capital includes common stock, paid in capital (share premium), reserve and surplus, and retained earnings. (Gautam and Thapa2060)

**Debt capital**

Debt capital includes all long-term borrowing incurred by the firm. Debentures, bonds, long-term loan etc. are major sources of debt or borrowed capital. A firm employs substantial amount of debt capital because of tax deductibility of interest payment, flexibility, and lower effective cost. However, excess amount of debt exposes high risk. Debt capital is the capital that a business raises by taking out a loan. It is a loan made of company typically as growth capital and is normally repaid at some future date.

**Development of commercial bank in Nepal**

Nepal bank Ltd. is the first modern bank of Nepal. It is taken as the milestone of modern banking of the country. Nepal Bank Ltd. remained the only financial institution of the country until the foundation of Nepal Rastra Bank is 1956 A.D. Due to the absence of the central bank, Nepal Bank has to play the role of central bank and operate the function of central bank. Hence, the Nepal Rastra Bank Act 1955 was formulated, which was approved by Nepal Government accordingly, the Nepal Rastra Bank was established in 1956 A.D. as the central bank of Nepal. Nepal Rastra Bank makes various guidelines for the banking sector of the country.

Rastriya Banijya Bank was established in 1965 A.D. as the second commercial bank of Nepal. As the agriculture is the basic occupation of major Nepalese, the development of this sector plays in the prime role in the economy. So, separate Agricultural Development Bank was established in 1968 A.D.

Today, the banking sector is more liberalized and modernized and systematic managed. There are various types of banks working in modern banking system in Nepal. It includes central, development, commercial, financial, co-operative and Micro Credit (Grameen) banks. Technology is changing day by day. And changed technology affects the traditional method of the service of bank. Banking software, ATM, E-banking, Mobile Banking, Debit Card, Credit Card, Prepaid Card etc. services are available in banking system in Nepal. It helps both customer and banks to operate and conduct activities more efficiently and effectively.

Commercial banks are the suppliers of finance for trade and industry, which plays vital role in the economic and financial life of the country. They help in the formation

of capital by investing the savings in productive areas. Rural people of under developed countries like Nepal need various banking facilities to enhance its economy. In most of the countries, the banks are generally concentrated in urban and semi-urban sectors. They neglect rural sector due to heavy risk and low return, which is in fact, without it, other sectors of economy cannot be flourished.

The commercial bank collects the scattered saving and place them into productive channels. They hold the deposit of many persons, government establishments and business units. They make funds available through their lending and investing activities to borrowers, individuals, business firms and government establishments. In doing so, they assist both the flows of goods and services from the government. They are media through which monetary policy is affected. These banks are resource for development. It maintains economic confidence of various segments and extends credit to people.

### **1.2 Problem statement**

Banking industry in Nepal is making remarkable progress and growth it's not without the problems. At the present context, the main problem faced by the business sector as well as bank is the unstable political and economic condition of the country. At the same time, there are very few profitable sectors where a bank can invest. This has forced the banks to lower down their interest rates to discourage deposit and, at the same period encouraged loan and advances. Due to security problem and political instability, government could not be able to pay sufficient attention to business and industry sector. Regulation and monitoring by government have been weakened in the banking sector as like others and unfair competition is increasing.

As different approaches hold different beliefs related to the determinants of capital structure on the value of the firm this study has been commenced, analyzing different aspect of commercial bank's capital structure which is done by taking Nepalese commercial banks as reference and has been tried to map out the current capital structure and the solvency as well as the relationship between debt equity ratio, long term debt to debt ratio, debt ratio, Return on Assets and Return on Equity of these commercial banks.

- i. What are the determinants of capital structure in Nepalese commercial banks?
- ii. What is the composition of debt and equity capital?

- iii. Is there any impact of ROA, BankSize, Growth rate or Tangibility of TDE?

### **1.3 Objectives of the study**

Each and every research study conduct with a view of achieving some objectives and this study is of no exception. The main objectives of the study are to examine and identify the determinants capital structure of Nepalese commercial banks. The specific objectives of this study are as follows:

- i. To examine the determinates of capital structure in Nepalese commercial banks.
- ii. To examine the composition of debt and equity capital.
- iii. To assess the impact of ROA, Bank size, Growth rate, and Tangibility on TDE.

### **1.4 Rational of the study**

Commercial banks can affect the economic condition of the whole country the effort is made to highlight the capital structure policy of commercial banks expecting that the study can balance the proportion of the equity and debt capital used by the commercial banks. Banking in this era has a new meaning and dimension which is now offering many extra services rather than just accepting deposits and granting loans. So, this study has been initiated to have a bird eye view on the capital structure of the commercial banks. This study tried to evaluate various aspects of capital structure as earning per share of bank, cost of capital, shareholder's equity etc. This research focused on the capital structure of Nepalese commercial bank and examines its financial position in various years by range of capital structure tools and various approaches. It primarily put spot light on the capital structure of Nepalese commercial bank and merely focuses on other aspects such as management, profit functions, banks performance etc.

This study done in reference to the periodical performance of Nepalese commercial bank. The study tried to focus on capital structure of the bank so the study could be significant in revising the bank capital structure for past five years at a glance. The study could be beneficial to various groups of people in following ways:

- i. Investors: This study provides the valuable information about the debt and equity (leverage) ratio of the selected Nepalese enterprise. Investors benefited by such information to perform securities analysis before taking investment decision.

- ii. Financial manager: Financial managers of Nepalese enterprise was benefited because they were get important information regarding optimum capital structure which will help them to make least cost combination of debt and equity.
- iii. Future Researchers: Researcher was get additional information in capital structure and cost of capital in the literature of finance. They were benefited by getting secondary data in this context.

The proposed study help to enhance the level of understanding in capital structure for other researchers, management scholars and other stakeholders.

### **1.5 Limitations of the study**

The study has been prepared by the help of the financial reports and publications of the bank. The thesis has been initiated with view of tracing out different aspect of capital structure of the bank and the calculation has been done by the figures given by the bank. Further, the study has been initiated by the student rather than by some economic or financial analyst so the study has some of its own limitations as stated below:-

- i. Study is mainly based on secondary data which have been collected from websites, books, financial statements and report
- ii. The overview of the study has taken into consideration some selected commercial banks so that the study might not cover the whole commercial banks.
- iii. The study is based on correlation and multiple regression methods of analysis and using secondary data of selected commercial banks so other research design and primary data is not taken into consideration.
- iv. This study focuses on specific internal variables those determinants the capital structure of banks such return on assets, bank size, growth rate, assets tangibility so other variables are not focus for the study.
- v. The study covers only 10 years data, beginning from 2010/11 to 2019/20.

### **1.6 Chapter plan**

The entire study is dividing into 5 chapters. Brief information of what each chapter contains is given below.

**Chapter I: Introduction**

It is an introductory chapter, which includes general background of bank. It also discusses about statement of problem, objective of the study, rational of the study and limitation of the study.

**Chapter II: Review of Literature**

This chapter deals with the review of literature. Which include theoretical review, review of empirical studies and research gap.

**Chapter III: Research Methodology**

It is concerned with research methodology. It includes research design, population, sample and sampling design, nature and sources of data, data processing procedure and data analysis method, research framework and variables definition.

**Chapter IV: Result and Discussion**

This is the heart of the chapter as it is concerned with presentation and analysis of relevant data and information. In order to find out the true picture of the determinants of capital structure of Nepalese Commercial banks, various financial and statistical tools and techniques are used. Thus, this chapter will concern with the findings of the analysis.

**Chapter V: Summary and Conclusion**

This chapter summarized the overall picture of the study, draws conclusions, offer suggestions and recommendations for improvement in the future.

Reference and appendices are also included at the end of the study.

## **CHAPTER II**

### **Review of Literature**

A literature review surveys books, scholarly articles, and any other sources relevant to a particular issue, area of research, or theory, and by so doing, provides a description, summary, and critical evaluation of these work in relation to the research problem being investigated.

This chapter divided in to three sections: section one describes the theoretical review, which is basically concerned with the concept and theories of capital structure. Section two presents the review of empirical works on determinants of capital structure of Nepalese commercial banks, and section three is concerned with research gap.

#### **2.1 Theoretical review**

##### **2.1.1 Approaches to capital structure**

There are number of capital structure theories proposed by different individuals which also create some controversy due to different concepts of capital structure theory hold by different personalities. This is the area in which several theoretical and empirical works have been done by different personalities. Capital structure theories developed so far revolve around the question of existence of the optimal capital structure. Most of the theoretical and empirical debuts so far are revolved around the maximization of the value of firms through the judicious composition of its debt and equity fund. Net income (NI) approach and Traditional theory of capital structure claims that there is the existence of the optimal capital structure. They contend that proper mix of debt and equity can maximize the value of the firms. Whereas, net operating income (NOI) approach and M-M hypothesis contend that capital structure is irrelevant to the value and cost of capital of the firm. According to the NOI approach, cost of equity increases linearly as debt increases in the capital structure. The use of debt does not affect the value of the firm as the benefit of debt capital is just offset by the increase in the cost of equity. (Ezra Solomon, 1969) Likewise, M-M hypothesis states that there is no level optimal capital structure. They support the NOI approach by providing logically consistent behavioral 27 justifications in its favor. Between the two extreme views, we have the middle position of intermediate version advocated by

the traditional writers. This section is developed to discuss briefly about the theoretical concept regarding the theories of capital structure and financial leverage. All the approaches are based on some common assumptions, which are as follows:

#### **Basic assumptions and definitions**

1. Two types of capital are employed, long term debt and shareholder's equity.
2. There is no tax on corporate income.
3. The firm's total assets are fixed but its capital structure can be changed immediately by selling debts to repurchase common stocks or stock to retire debt.
4. All investors have the same subjective probability distribution of expected future operating earnings (EBIT) for a given firm, that is, investors have homogeneous expectations.
5. The operating earnings of the firm are not expected to grow, that is, the firm's expected EBIT is same in all future periods.
6. The firm's business risk is constant over time and is independent of its capital structure and financial risk.
7. The firm is expected to continue indefinitely

#### **The trade off theory & financial distress costs**

The trade-off theory, based on research on taxes (Modigliani and Miller, 1963) and bankruptcy and financial distress costs (Warner, 1977) and the insights from the agency literature (Jensen and Meckling, 1976), suggests that firms have a unique optimal capital structure that balances between the tax advantage of debt financing (i.e. debt tax shields), the costs of financial distress and the agency benefits and costs of debt. Then the trade-off theory predicts optimal capital structure.

Optimal capital structure is a combination of funding sources which consist of debt and stock that will yield the highest value of the firm. One indication of the high value of the company is the high stock prices. Thus, the optimal capital structure is a capital structure that generates the highest stock price. Another indication of an optimal capital structure is lowest cost of capital weighted (Weighted Average Cost of Capital - WACC).

Trade of theory of capital structure compares benefits and costs of issuing debt as an attempt to reach to the optimal point of financial debt ratio that maximizes firm's value (Myers, 2001). The theory considers three main factors: taxes, costs of financial

distress or bankruptcy costs and agency conflicts (Modigliani and Miller, 1963). Trade of theory aims to maintain a balance between these three factors to achieve capital optimal structure. According to this theory, taxes play significant role in determining the firm's level of leverage by lowering tax liability and increasing after-tax cash flows. However, when a firm raises excessive debt to finance its operations, it may default on this debt and be subject to bankruptcy. Accordingly, trade of theory claims there is a positive relationship between the value of the firm and a realistic level of tax (Warner, 1977). Trade of theory explains the organization's optimal capital structure as the mix of financing that links the marginal costs and benefits of debt financing. It is fair to state that Trade of theory can be hold if there is a positive relationship between profitability from one side and financial leverage in the other side.

### **Pecking order theory**

Pecking order theory (Myers and Majluf (1984) and Myers (1984)) and the extension of this theory (Lucas and McDonald, 1990) studied based on the asymmetric information between managers and investors. Managers have more information about the true value of the enterprise and enterprise risk compared to outside investors. According to Myers (1984), firms finance their activities with retained earning when feasible. If the return earning are inadequate, then debt is used. Only in extreme cases will firms use new equity finance. Thus, the order of financial sources used was the source of internal funds from profits, short-term securities, debt, preferred stock and common stock last. Pecking order theory predicts that the issuance of equity (common stock) is the last alternative sources of funding.

As described by Myers (1984), the pecking order theory suggests that firms first prefer internal sources of finance, and they adjust their target dividend payout ratio to their investment opportunities. If the firms seek external finance, due to generous dividend policies, unpredictable fluctuations in profitability or investment opportunities, firms will choose debt (as the safest instrument), and then hybrid securities such as convertible bonds, and then equity as a last resort. The pecking order theory generally explains why firms might rationally let cash flows determine leverage. This suggests that firms turn to debt funds under pressure of an internal funds shortage.

### **Net income approach**

David Durand proposed the Net Income Approach. This approach states that firm can increase its value or lower the cost of capital by using the debt capital. According to NI approach, there exists positive relationship between capital structure and valuation of firm and change in the pattern of capitalization bring about corresponding change in the overall cost of capital and total value of the firm. Thus, with an increase in the ratio of debt to equity, overall cost of capital was decline and market price of equity stock as well as value of firm will rise. The converse was hold true if ratio of debt to equity tends to decline. The approach assumes no change in the behavior of both stockholders and debt holders as to the required rate of return in response to a change in the debt-equity ratio of the firm. They want to invest since debt holder are exposed lesser degree of risk, assumed of a fixed rate of interest and are given preferential claim over the profit and assets, the debt holders' required rate of return is relatively lower than that of equity holders. So, the debt financing is relatively cheaper than equity. For this reason, at constant cost of equity ( $K_e$ ) and cost of debt ( $K_d$ ), the overall cost of capital ( $K$ ) declines whit the increased proportion of the debt in the capital structure. This suggests that higher the level of debt, lower the overall cost of capital and higher the value if firm. It means that a firm attends an optimal capital structure when it uses 100% debt financing. Running a business with 100% debt financing, however, is quite uncommon in the real world.

#### **This approach is based on the following assumptions:**

1. The cost of equity and debt remain constant the acceptable range of leverage.
2. The corporate income taxes do not exist.
3. The cost of debt rate is less than the cost of equity.
4. The increasing leverage brings about no deterioration in the equity of net earnings long as borrowing is consigned to the amount below the acceptable limits.

### **Net operating income approach (NOI)**

Under NOI approach, the Net operating income, i.e., the earnings before interest and tax (EBIT), instead of net income is taken as the base. Like the NI approach, the NOI approach also assumes a constant rate  $K_d$ , which means that the debt holders do not demand higher rate of interest for higher level of leverage risk. However, unlike the assumption of NI approach, NOI approach assumes that the equity holders do react to

higher leverage risk and demand higher rate of return for higher debt-equity ratio. This approach says that the cost of equity increases with the debt level and the higher cost of equity offset the benefit of cheaper debt financing, resulting no effect at all on Overall Cost of Capital (K).

NOI approach is another behavioral approach suggested by Durand David. This approach is diametrically opposite from the NI approach with respect to the assumption of the behavior of equity holders and debt holders. The essence of this approach is that the leverage/capital structure decision of the firm is irrelevant (Khan & Jain). The overall cost of capital is independent of the degree of leverage; any change in leverage was lead to change in the value of the firm and the market price of the shares. Net operating approach is slightly different from NI approach, unlike the NI approach in NOI approach, the overall cost of capital and value of firm are independent of capital structure decision and change in degree of financing. Leverage does not bring about any change in the value of firm and cost of capital.

### **Modigliani and Miller approach: No taxes modern**

Capital structure theory began in 1958, when MM published what has been called the most influential finance article ever written. MM's study was based on some strong assumptions, which included the following as

1. There are no brokerage costs.
2. There are no taxes.
3. There are no bankruptcy costs.
4. Investors can borrow at the same rate as corporations.
5. Investors have the same information as management.
6. EBIT is not affected by the use of debt.

The perfect markets theory of capital structure contradicts the "real world" approach. The corporation can mix any proportion of debt and equity to build capital structure without any effect on firm value because the value is independent of its capital structure as MM 1958 state and the determinant factor for firm value is future earnings power(future cash inflow).Although, keep in mind that these propositions assume a perfect capital market.

The proposition of no taxes or irrelevant proposition can be stated as Ross et al, (2011), MM Proposition I (no taxes): The value of the levered firm is the same as the

value of the unlevered firm. This is the first proposition of the MM theorem in absence of taxation. It simply states that, in perfect financial markets, the value of a levered company is exactly the same as an unlevered company.

### **Modigliani and Miller II: The effect of corporate taxes**

When MM introduced taxes into their proposition in 1963 the result was altered. It was shown that it was beneficial for firms to include debt in their capital structure. Firms that are partly financed by debt can deduct the interest it pays on its debt, from the tax it has to pay on its income as MM 1958. It creates a higher total value for a firm that is financed with debt and equity, a leveraged firm, than for a firm that is financed only with equity, an unleveraged firm. The value of firm is equal to the value of the firm's cash flow with no debt tax shield (value of an all equity firm) plus the present value of tax shield in the case of perpetual cash flows.

### **Financial leverage**

Financial leverage involves the use of funds obtained at fixed costs in the hope of increasing the return to stockholders. Weston and Brigham (Weston and Brigham; 1981:556) defined financial leverage as the ratio of total debt to total assets or total value of the firm. The use of the fixed charges sources of funds, such as debt and preference share capital along with the owner's equity in the capital structure, is described as financial leverage or 'trading on equity' ( Pandey ; 1999:23). Trading on equity is derived from the fact that it is the owner's equity that is used as a basis to raise debt, i.e., the equity that is traded upon. The supplier of debt has limited participation in the company's profit; therefore, debt holder will insist on protection in earnings and value represented by ownership capital.

## **2.2 Review of empirical studies**

### **2.2.1 International context**

Timilsina (2020) analyzed the determinants of capital structure in Nepalese Commercial Banks. The study mainly based on secondary data of 16 commercial banks with 112 observations for the period 2011/12 to 2017/18. The total debt to total assets and total debt to total equity were selected as dependent variables while return on assets, bank size, assets tangibility, assets growth and liquidity are the independent variables. This research employed Pearson's correlation coefficients and regression models are estimated to test the significance and impact of bank specific factors on

the capital structure of Nepalese commercial banks. The result showed that banks size and assets tangibility are positively correlated with total debt to total assets whereas return on assets, assets growth and liquidity are negatively correlated with total debt to total assets. Likewise return on assets, bank size, assets tangibility, assets growth and liquidity are negatively correlated with total debt to total equity. This study indicated that higher assets growth, return on assets and liquidity lower would be the total debt to total assets and total debt to total equity. Likewise higher the bank size and assets tangibility higher would be the total debt to total assets. This research further concluded that return on assets, bank size and assets tangibility are the most influencing factors and assets growth and liquidity are the least influencing factor affecting the capital structure of Nepalese commercial banks.

Dhodary (2019) examined the determinants of capital structure in Nepalese trading and manufacturing firms. The study covered eleven major non-financial enterprises of trading and manufacturing firm's specific variables. Firm's size, growth opportunity, asset tangibility, profitability, firm's age, liquidity and interest coverage ratio have selected as variables to examine their effect on corporate capital structure. The study used both descriptive and causal comparative research design to examine the determinants of capital structure. Data required for undertaking the study were collected from secondary sources. The study found positive relationship between asset tangibility and leverage. This result indicated that companies with more tangible assets use more long-term debt. The study concluded that asset tangibility, profitability, liquidity and interest coverage ratio are the major determinants of corporate capital structure in Nepalese trading and manufacturing firms.

Ariyani and Raharjo (2018) examined the effect of asset structure, profitability, firm size and company growth on the capital structure of manufacturing companies listed on the Indonesia Stock Exchange (IDX) in 2013 – 2017. This study used purposive sampling that was 52 companies in the criteria. Data obtained from the Financial Reports and Performance Reports published in the Indonesian Capital Market Directory (ICMD). The analytical tool that used is multiple regression. Hypothesis testing is done by the F test, t-test and determination coefficient. This research found that asset structure has a positive effect on the capital structure and not significant to the capital structure, profitability has a negative and significant effect on the capital

structure, the size of the company has a positive and significant effect on the capital structure, and the company's growth has a negative and significant effect on the capital structure. This research suggested that capital structure is influenced by the size of the company, which states that the size of the company does not affect the capital structure.

AbuTawahina (2015) analyzed the overall effect of capital structure on corporate financial performance of Palestinian firms by establishing the relationship that may exist between the capital structure choices of firms in Palestine and their financial performance. This study used three financial performance measures including return on assets (ROA), return on equity (ROE), and return on investment (ROI) as dependent variables and three capital structure measures including short term debt to total assets (STDTA), long term debt to total assets (LTDTA) and total debt to total assets (TDTA) as independent variables. The firm size and industry type was used as control variables. The population of this study consists of 49 Palestinian corporations listed on Palestine Exchange (PEX). 35 Corporations were selected on the basis of availability of information necessary for conducting the study and the readiness of annual financial reports for the period of 5 years from 2009-2013. Descriptive statistics, correlation and multiple regressions were used to test the relations between variables. The results showed that there is a relationship between capital structure and corporate financial performance, there is a negative influence for STDTA and TDTA on financial performance measurements except the ROE. This study concluded that Palestinian firms are majorly financed by mixing of equity and short-term financing. The study recommended the firms to achieve the best debt ratio with the minimum cost to maximize the financial performance also, the firms should rely less on short term debt which formed the major part of their leverage and focus more on developing internal strategies that can improve their financial performance.

Mutairi & Naser (2015) identified determinants of capital structure in a sample of commercial banks listed on the Gulf Cooperation Council (GCC) stock markets. To achieve this objective, data were collected from 47 GCC commercial banks for the period between 2001 and 2010. This research found that profitability and liquidity affect banks capital structure decision. This study concluded that the majority of the commercial banks assets in GCC financed by debts which represents more than 80

percent of the capital of the banks. This research recommended that the importance of long-term debts in commercial banks financing in GCC.

Badar & Saeed (2013) examined the impact of firm's capital structure components and leverage on firm's performance. This study used 10 firms of food sector as a sampled, all the firms are listed on Karachi stock exchange & data duration of this paper consists of five years from 2007-2011. Variables used in this paper are assets turnover ratio, return on assets, current liabilities to total assets, long term debts to total assets and debt to equity ratio. Results are derived by applying multiple regression models. The results showed that there is a significant positive impact of long-term debts on firm's performance and significant negative impact of short-term debts on firm's performance. There is a negative relationship of firm's leverage on firm's performance. As firm's leverage increases its performance decreases. There is a negative relationship between them. The Results showed that firms using high number of short-term debts are facing negative trend in performance. The results recommended that firms must try to use long term debts in their financing rather than short term loans because these are more expensive than long term debts.

Ahmadimousaabad, Anuar, Sofian & Jahanzeb ( 2013) investigated the determinants of capital structure of Iranian firms listed on Tehran Stock Exchange for the period between 2001 and 2010. The study used data set of 123 (1230 observation) companies for the 10 years period is collected from published annual reports of companies from Tehran Stock Exchange. The study explored the traditional financial theories (Trade-off theory and Pecking order theory) to investigate the determinants of capital structure. The variables of size, profit, growth, tangibility, and risk factors are included to represent the potential influence of traditional theories. The result indicated that the size and risk are positively related to capital structure. In addition, profitability, growth and tangibility are negatively related to capital structure. The study further showed that firm size is consistent with the trade-off theory and result of profitability is consistent with the pecking order theory. This result recommended that financial factors are important determinants of Tehran stock exchange, whereas for the future research financial issues also consider to explain the capital structure of Tehran stock exchange in order to better appreciate the relationship.

Arulvel & Ajanthan( 2013) explained the importance of capital structure decision for a firm. It is important not only from a return maximization point of view, but also this decision has a great impact on a firm's ability to successfully operate in a competitive environment. The ability of companies to carry out their stakeholders' needs is tightly related to capital structure. Capital structure in financial term means the way a firm finances their assets through the combination of equity, debt, or hybrid securities. This study investigated the relationship of capital structure and financial performance of trading companies which are listed in CSE (Colombo Stock Exchange) from 2007 to 2011. The result showed that debt ratio is negatively correlated with all financial performance measures [Gross Profit (GP); Net Profit (NP); Return on Equity (ROE) and Earnings Per Share (EPS)] similarly debt-equity ratio (D/E) is negatively correlated with all financial performance measures except GP and only (D/E) ratio shows significant relationship with NP. R2 (Regression) value of financial performance ratios indicate that 36.6%; 91.6%; 36% and 11.2% to the observed variability in financial performance is explained by the debt/equity and debt ratios.

Shubita & Alsawalhah (2012) analyzed the effect of capital structure on profitability by examining the effect of capital structure on profitability of the industrial companies listed on Amman Stock Exchange during a six-year period (2004-2009). The problem statement to be analyzed in this study is: Does capital structure affect the Industrial Jordanian companies? The study sampled consists of 39 companies. The study employed correlations and multiple regression analysis the results reveal significantly negative relation between debt and profitability. The results indicate that a significantly negative relationship between short-term debt and profitability. The results also show that profitability increases with control variables; size and sales growth Regression. This studies further showed that a significantly negative association between LDA and profitability. This study recommended that profitable firms depend more on equity as their main financing option. This study recommended that findings are offered to improve certain factors like the firm must consider using an optimal capital structure and future research should investigate generalizations of the findings beyond the manufacturing sectors.

Culata (2012) analyzed the econometrically test whether the listed companies in Indonesian stock exchange follow the pecking order theory or the tradeoff theory.

The trade-off theory predicts optimal capital structure, while the pecking order theory does not predict an optimal capital structure. According to pecking order theory, the order of financial sources used is the source of internal funds from profits, short-term securities, debt, preferred stock and common stock last. Samples in this study are public companies listed during 2009-2010. The research questions are tested by running regression models. The result of this study showed that the pecking order theory is not supported, while the trade-off theory is supported. The study recommended that the capital structure of listed companies in Indonesian Stock Exchange is financed based on optimal capital structure, not by the order financial resource.

Karadeniz, Kandur & Iskenderoglu (2011) investigated the role of firm size on capital structure decisions of Turkish lodging companies. This study employed a survey questionnaire as method to unquoted Turkish lodging companies, 163 lodging companies answered the survey and they are classified according to their sizes. This study found that firm size is a significant factor for capital structure decisions of Turkish lodging companies. Firm size seems to affect lodging companies in using incentives, issuing common stock, using personal debt and determining target debt ratio. Most of the empirical resulted seems to support pecking order theory. This study recommended that compare capital structure of unquoted tourism companies in various countries.

Gajurel (2005) analyzed determinants for a penal set of 20 non-financial firms listed in NEPSE for 1992-2004. The study used decomposition analysis, properties of portfolio analysis, econometric analysis and opinion survey of managers. The study found that Nepalese firms are highly levered, however the long-term debt ratio is significantly low. Asset's structure and size are observed positively related to leverage whereas liquidity, risk, growth, non-debt tax shield is negatively related to leverage. The study concluded that both pecking order and tradeoff theories are at work in explaining capital structure of Nepalese companies. This study further analyzed that Nepalese manager prefer internal financing first followed bank loan financing. This study recommended that firms can be benefited by employing moderate level of debt rather low or extremely high, reliance on short term debt may not be the positive signal for the profitability and liquidity.

### 2.2.2 National context

Shah (2006) examined the relation between return on equity and total debt, return on equity and debt ratio. Earnings after tax and total debt and interest and earnings before interest and tax. This study used both financial as well as statistical tools. The financial tools used were ratio analysis and statistical tools used were correlation coefficient and regression analysis. The study indicated that Nepal lever Ltd has not been using long term debt and it was fully equity based. The bottlers Nepal Ltd is free of long term debt because of improved cash flows and effective management. The study further indicated that Sriram spinning mills has 66.33% of assets financed with debt and hence there is less flexibility to the owners. The study concluded 49 financial leverage analysis of Jyoti spinning mills shows the failure of the company to gain expected profits. And the Arun Vanaspati Udhyog has a fluctuation Debt Equity ratio. Its long term debt is decreasing and only creditors make a small share of equity.

Neupane (2002) analyzed the different financial aspects of Nepal bank limited. This study used different ratio, analysis of component parts of capital structure; debt equity ratio, net worth, deposit/investment ratio. This study remarked that the total deposit and total investment were not significantly related. This research concluded that the net worth was used in unproductive assets of the bank. This research commended that the bank needs to have productive use of its net worth.

Kafle (2001) analyzed of Capital Structure Between Lumbini Sugar Factory Limited and Birjung Sugar Factory Limited. This study employed various ratio of capital structure decision, net worth, earnings before interest and tax and to suggest measures to improve the policy of the companies. According to researcher both the companies were facing serious deterioration in earnings according to the net operating income approach. Researcher noted down both the companies had defective capital structure as debt equity ratios were not so much satisfactory. This study showed that Birgunj 48 Sugar Factory had high debt equity ratio indicating more financial risk while Lumbini Sugar Mills had low debt equity ratio which indicates access power of equity holders. And both the companies were unable to pay interest because they were operating at loss. As Birgunj sugar Factory was highly levered Lumbini Sugar Factory was unlevered both the companies had defective capital structure. This study suggested

that it should change the debt equity ratio for sound capital structure management to maintain it in 1:1 ratio.

Pathak (1995) analyzed the debt equity ratio, interest coverage ratio with some of the measures to improve the policy. This study employed all the variables in the form of ratio analysis. The study found that the capital structure and profitability position, the shareholder's equity and the trend of debt –equity the ratio was increasing every day. Company's debt serving capacity was very poor due to the negative interest coverage ratio. The operational performance was not satisfactory due to negative earnings and low volume of sales revenue. The company was not able to utilize its capacity more than 50% which result the huge losses. This study suggested that lowering down the amount of debt and obtaining additional funds through issue of equity share, improving its working capital and reducing over staff, making strategic plans and developing the motivations management.

Shrestha (1999) accessed on debt serving capacity of the companies and as well as return on equity, debt ratio, following the calculation earnings before interest and tax, earning per share. This research observed that manufacturing companies had a higher risk with higher return on the interest and debt and low dividend. This study further indicated that the amount of profit earned could only meet the interest and because of that had to suffer losses. This study concluded that there was not enough return to pay interest, debt and dividend for both types of companies although maintaining a high risk of debt. This study recommended for a regular checkup the level of debt, earnings before interest and tax (EBIT), earning before tax (EBT) and earnings per share (EPS) by monitoring authority, so that the companies would not fall into a weaker position.

Prashai (1999) analyzed the interrelationship and trends among some of the component parts of capital and assets structure and to provide suggestions for the development of an appropriate capital structure. This study employed financial tools such as ratio analysis and statistical tools such as Karl Pearson's co- efficient ratio percentage, Index and average to analyze the relation between various variables. It is known that the bank is composition of loan and advances, cash investment and other assets. Between all these components, loan and advance are the major portions. During the study, total assets and capitals are in increasing trend. But increasing rate of component is different. So the interrelationship of the component is fluctuating.

The study found that growth rate of total deposits and other liabilities is higher than the average growth rate of net profit, and higher than the growth rate of total expenses. The study further showed that total income and total expenses aren't under control of the bank, and the net profit is only 40.64% of the total income. The study suggested that the bank must control total deposit and the bank must also control investment. The bank needs to reduce its expenses and control fluctuations in the earnings per share to improve its market price per share.

### **2.3 Research gap**

During the review of previous studies, it was found that most of the researches (Timilisna 2020, shrestha 2010,) has been conducted on the determinants of capital structure of Nepalese commercial banks. During the review of the previous thesis, it was found that no research has been conducted by taking these sample banks and these data. Present study is based on the data taken from four commercial banks.

By reviewing an earlier thesis, it was found that researchers only analyzed components parts of capital structure ratios, its interrelationship, debt serving capacity, relation between return on equity-debt, earning before tax and interest. This study also examines the impact and relationship of determinants of capital structure with other capital indicators like bank size, assets tangibility, assets growth, total debt to equity, total debt to assets of the firms.

## CHAPTER- III

### Research Methodology

This chapter refers to the overall research methods from the theoretical aspects to the collection and analysis of data. Its focus is made on the application of the technique and procedure to analyze the relevant variables to see the basic relationship between relevant topics. To achieve the basic objectives both financial and statistical tools have been adopted. This chapter contains the research design, population and sample, sources of data collection, data collections techniques, data processing and data analysis tools and techniques.

#### 3.1 Research design

Research design is the framework of research methods and techniques chosen by a researcher. A research design is plans that guide the arrangement of conditions for collection and analysis of data. This research study is attempting to analyze the internal factors of commercial banks and determinants of commercial banks. According to the objective of the study, descriptive research design is used. Thus, to fulfill the objectives of the study secondary data are used.

#### 3.2 Population, sample and sampling design

The total population of the study is 27 commercial bank in Nepal. According to the convenience sampling method Century Bank Limited, Sunrise Bank Limited, Nabil Bank Limited and Machhapuchchhre Bank are chosen as a sample of study. The study aims to explore the determinants of capital structure of sampled banks. It is based on recent ten years data from Fiscal year 2010/11 to Fiscal year 2019/20.

**Table 3.1 Number of commercial banks selected for the study**

S. No	Name of commercial banks	Study period
1.	Century bank	2010/11-2019/20
2.	Sunrise bank	2010/11-2019/20
3.	Nabil bank	2010/11-2019/20
4.	Machhapuchchhre bank	2010/11-2019/20

### **3.3 Nature and sources of data**

This study is based on secondary data provided by sampled banks. Data and information have been extracted from the annual reports of the bank collected from the concerned bank and downloaded from official websites. The supplementary data and information have been acquired from various sources like newspaper, magazines, brochures, booklets, periodicals and bulletins, related documents and journals available in library of Tribhuvan University, and other organization like Nepal Rastra Bank.

### **3.4 Data processing procedure and data analysis method**

Different tools have been selected according to the nature of data as well as subject matter. The major tools employed for the analysis of the data is the ratio analysis which established the quantities or numerical relationship between two variable of the financial statement. Besides there the statistical tools and in software SPSS version 2007 are also used.

### **3.5 Data analysis tool**

The data collected from different sources recorded systematically a necessary useful and related data are grouped as per need of the research work. Data are presented in appropriate the data collected from different sources recorded systematically necessary only form of tables, graphs, and charts. To analyzed the data in this research, some financial and statistical tools are used which are explained here.

#### **3.5.1 Financial tools**

For the proper financial analysis of data ratio analysis is the best tools. It is very simple analyzing tools under which ratios are taken to express the relation between two or more data. Through ratio analysis the researcher can establish the relationship among the data and research into conclusion. Under ratio analysis the following ratios related to banks are analyzed.

##### **a. Total debt assets ratio**

The debt to assets ratio is a measure of the financial leverage of the company. It tells you what percentage of the firm's assets is financed by debt and is a measure of the level of the company's leverage. It is calculated as debt divided by total assets.

The total debt of the firm comprises long term debt plus current liabilities while total assets consist of permanent capital plus current liabilities.

$$\text{Total debt assets} = \frac{\text{Total debt}}{\text{Total asset}}$$

#### **b. Total debt equity ratio**

Leverage Ratio measures the contribution of financing by owners compared with financial provided by the outsiders. They also provide some measure of the debt financing by the calculation of the coverage of fixed charge. It is one of the most popular tools of the long term financial solvency of the firm. It can be calculated by the long term debt divided by shareholders' equity. In the calculation, shareholders' equity preference share capital accumulated losses, discount on issue of share etc, so the shareholders' equity is defined as net worth and D/E ratio also called debt to net worth ratio related with the total debt. This debt equity measures the claim of the creditors an owner against the company's assets. In this study following leverage ratios have been calculated

$$\text{Debt to equity} = \frac{\text{Total debt}}{\text{Total equity}}$$

#### **c. Return on assets**

Return on assets is defined as net income divided by total assets. The return on assets which is often called the firm's return on total assets, measure the overall effectiveness of management in generating profit with its available assets. Return on assets measures the profit earned per dollar of assets and reflect how well bank management uses the bank's real investments resources to generate profits (Naceur, 2003). Nassar (2016) revealed that the high level of debt negatively affects a firm's return on assets.

$$\text{ROA} = \frac{\text{Net income}}{\text{Total assets}}$$

#### **d. Bank size**

Bank size is measured by the total assets of the firm. Larger sized firms usually are more diversified and have more stable cash flow, therefore they are less risky. This will result in lower cost of debt as well as easier access to the external debt markets.

**Bank size=Total assets**

**e.Assets growth rate**

Assets growth is defined as the Percentage of assets of current year minus assets of previous car divided by assets of current year. Assets are the economic resources of a company expected to benefit the firm's future operations.

$$\text{Growth rate} = \frac{(\text{assetsofcurrentyear} - \text{assetsofpreiousyear})}{\text{assetsofcurrentyear}}$$

**f. Assets tangibility**

Assets tangibility is defined as net fixed assets divided by total assets. It is considered to be one of the most significant determinants of capital structure and firm's performance (Chechet et al., 2013). Firm that invest more of its retained earnings in tangible assets will have low bankruptcy cost and financial distress so firms relies on intangible assets (Akintoye, 2008).

$$\text{Assets tangibility} = \frac{\text{Fixed asstes}}{\text{Total assets}}$$

**3.4.2 Statistical tools**

Statistical tools are the mathematical techniques used to analyze and interpret performance. It is used to describe the relationship between the variables and interpret the result. Statistics are also used to test the objectives that are set to know the information of the population. The research holds various statistical tools, which are defined as follow.

**a. Mean**

Among different measures of central location, the best known and the most widely used is the arithmetic mean, or simply the mean. It is the sum of the values divided by their number. It can be calculated for any set of the numerical data, so it always exists. The mean can be expressed symbolically as,

$$\bar{X} = \frac{\sum X}{n}$$

Where,

$\bar{x}$ = arithmetic mean

$\Sigma X$  = Sum of Values of all items, and

N = Number of items

### **b. Standard deviation**

The standard deviation measures the absolute description. It is defined as the positive square roots of the mean of the square of the deviations taken from the arithmetic mean. If the standard deviation is greater, the magnitude of the deviation also is greater. A small standard deviation means a higher degree of true/ fact and vice- versa. This can be symbolically as:

$$\sigma = \sqrt{1/n \sum (X - \bar{X})^2}$$

Where,

$\sigma$  = standard deviation

n = number of observation

$\bar{X}$  = arithmetic mean

### **c. Coefficient of variation (C.V)**

Coefficient of variation is a relative measure of dispersion, which can be obtained by expressing the standard deviation as a percentage of mean. The CV is applicable for the comparison of variability of two or more distractions. It is a relative measure and is independent of units. The greater the value of CV, the higher the variability and the smaller the value of CV, the lower will be the variability. This is given by:

$$C.V = \frac{\sigma}{\bar{X}}$$

Where,

$\sigma$  = standard deviation

$\bar{x}$  = mean

### **d. Correlation coefficient (r)**

Correlation analysis is the statistical tool that can be used to describe the degree to which one variable is linearly related to another. The correlation coefficient measures the degree of relationship between two sets of figures. Correlations coefficient is most widely used in practice. Correlation can either be positive or it can be negative. It is denoted by r. Its value lies between -1 to +1. When r = -1,

it means, there is perfect negative relation between variables and when  $r = +1$ , it means, there is a perfect relation between variables.

**e. Regression analysis**

Regression analysis is the development of the statistical model that can be used to predict the values of the dependent variable based upon the value at least one of independent variables. Regression analysis helps us to know the relative movement in the variables.

The multiple regression method is used in this analysis which can be described as bellows:

**Multiple regression analysis**

This is defined as a statistical device which is used to predict the most probable value of a dependent variable on the basis of the known value of two or more independent variables so, this is a logical extension of the simple regression analysis. In this study, the following multiple regression equation is analyzed.

$$TDE = a + b_1 ROA + b_2 SIZE + b_3 TANGILILITY + b_4 GROWTH \dots \dots \dots (i) .$$

$$TDA = a + b_1 ROA + b_2 SIZE + b_3 TANGIBILITY + b_4 GROWTH \dots \dots \dots (ii)$$

**3.5 Research framework and definition of variables**

The study consists of following set of six variables to explore the determinants of the capital structure. The study consists of capital structure as dependent variables which are followed from the dependent variables of an existing literature, while the five independent variables are followed from the independent variables of existing literatures:

Figure: 1 conceptual framework

source: (Timilsina 2020)

### **Independent variables**

**ROA:** Return on assets is defined as net income divided by total assets. The return on assets which is often called the firm's return on total assets, measure the overall effectiveness of management in generating profit with its available assets. Return on assets measures the profit earned per dollar of assets and reflect how bank management uses the bank's real investments resources to generate profits (Naceur, 2003). Nassar (2016) revealed that the high level of debt negatively affects a firm's return on assets. Antoniou et al. (2008) revealed that the leverage ratio decline with the increase of a firm's profitability, and finds that the degree and effectiveness of profitability as a determinant is dependent on the country's legal and financial traditions. Phung and Le (2013) found that on firm performance such as ROA and ROE has negative impact on capital structure return on assets (ROA) is an indicator of how profitable a company is relative to its total assets.

**Bank size:** Bank size is measured by the total assets of the firm. Pervan and Visic (2012) showed that the firm size has a significant (but weak) positive influence on firm leverage. Similarly, the study of Dogan (2013) indicated a positive relation between size indicators and capital structure of firms. The results showed that the larger firms reached higher economic performance compared with smaller ones. These finding indicates that economies of scale are likely to play an important role in sector of raising swine (Kuncova et al., 2016). However, Olawale et al., (2017) revealed that firm size in terms of total assets has a negative effect on financial leverage. Larger sized firms usually are more diversified and have more stable cash flow, therefore they are less risky. This will result in lower cost of debt as well as easier access to the external debt markets. The study suggested that there is a positive relationship between size and leverage (Alzomaia, 2014).

### **Assets growth rate:**

Assets growth is defined as the Percentage of assets of current year minus assets of previous car divided by assets of current year. Assets are the economic resources of a company expected to benefit the firm's future operations. Mutai (2014) indicated a positive but insignificant relationship between financial leverage and asset growth of firm. Sarchah & Hajiha (2013) found that asset growth had a positive significant effect on leverage. Zhao and Wijewardana (2012) revealed that financial Leverage is

positively related to the growth and financial strength. Growth provides additional capabilities, opportunities, revenue and profit (Maggina and Tsaklanganos, 2012). Firms with a high proportion of non-collate realizable assets (such as growth opportunities) could find it more expensive to obtain credit because of the asset substitution effect (Titman and Wessels, 1988).

**Assets tangibility:**

Assets tangibility is defined as net fixed assets divided by total assets. It is considered to be one of the most significant determinants of capital structure and firm's performance (Chechet et al., 2013). Firm that invest more of its retained earnings in tangible assets will have low bankruptcy cost and financial distress so firms relies on intangible assets (Akintoye, 2008). There exists a positive relationship between asset tangibility and a firm's debt ratio, that is, larger the tangible assets, higher would be the leverage (Anafo et al., 2015). Likewise, the propositions of the trade-off theory Kraus and Litzenberger (1973) suggested that tangible assets insert a positive impact on debt borrowing decisions since they have value in case of bankruptcy, in contrast to intangible ones.. MacKie- Mason (1990) concluded that a firm that has more tangible assets in its asset base is likely to choice debt and this affect the firm's performance. There is a positive association between tangibility and leverage (Gurunlu and Gursoy, 2010)

**Dependent variables**

**Capital structure:** Capital structure refers to the mix of long term sources of funds, such as debentures, long term debt, preference share capital and equity share capital including reserves and surplus.

**Total debt assets:**

The debt to assets is a measure of the financial leverage of the company. It tells you what percentage of the firm's assets is financed by debt and is a measure of the level of the company's leverage. It is calculated as debt divided by total assets. The total debt of the firm comprises long term debt plus current liabilities while total assets consist of permanent capital plus current liabilities. Assets may be described as valuable resources owned by a business which have been acquired at a measurable money cost. Assets as an economic resource satisfy three requirements. They are firstly, the resources must be valuable or it may provide future benefits to the

operations of the firms; secondly, the resources must be owned, and thirdly the resources must be acquired at a measurable money cost. When intangible assets are the significant, they are frequently deducted from net worth to obtain the tangible net worth of the firm.

**Total debt equity:**

Total debt equity measures the contribution of financing by owners compared with financial provided by the outsiders. They also provide some measure of the debt financing by the calculation of the coverage of fixed charge. It is one of the most popular tools of the long term financial solvency of the firm. It can be calculated by the long term debt divided by shareholders' equity. In the calculation , shareholders' equity preference share capital accumulated losses, discount on issue of share etc, so the shareholders' equity is defined as net worth and D/E ratio also called debt to net worth ratio related with the total debt.

## **CHAPTER- IV**

### **RESULT AND DISCUSSION**

This is the most important chapter of the study. In this chapter the data collected will be analyzed and presented mathematically. All the above-mentioned financial and statistical tools will be used to present the data.

To analyze the financial performance in respect to capital structure, various presentation and analysis have been presented in this chapter according to analytical research design mentioned in the third chapter using various financial and statistical tools.

It is already stated that Capital structure refers to the combination of preference share, equity share capital including reserve and surplus as well as long-term debt. Optimal capital structure refers to that combination of funds, which maximizes the EPS, value of the firm and overall cost of capital. The analyses in this chapter are divided into following sections, which is directly and indirectly related to the capital structure.

#### **4.1. Capital structure analysis**

##### **4.1.1 Total Debt equity ratio**

The debt-to- equity ratio is used to analyze financial risk both by creditors and the firm.

**Table 4.1***Debt-equity ratio*

Fiscal year	BANK			
	CBL	SBL	NABIL BANK	MBL
2010/11	0.85914	0.217446	0.2352	0.02573
2011/12	0.155121	0.189868	0.1797	0.0295
2012/13	0.12258	0.277833	0.3927	0.0510
2013/14	0.163638	0.086129	0.64711	0.8219
2014/15	0.124679	0.085555	0.31833	0.1708
2015/16	0.095141	0.546766	0.0761	0.3386
2016/17	0.127566	0.181328	0.6098	0.295
2017/18	0.251161	0.297209	0.1656	0.02134
2018/19	0.180454	0.246952	0.0269	0.0510
2019/20	0.12258	0.277833	0.3927	0.7458
Mean	0.149346	0.24109	0.2275	0.2906
S.D	0.023701	0.171134	0.2176	0.2738
C.V	0.1587	0.709834	0.9565	0.9420

*Source: Annual report of sampled bank***Figure 4.1***Debt to equity ratio*

The table 4.1 and figure 4.1 show the descriptive statistics -mean SD and CV of each year debt equity ratio and the trend of debt equity ratio of selected banks in ten year periods. In each of the study MBL has the highest 27.38% SD and CV is 94.20%. The debt equity ratio as compared to others commercial banks. Similarly SBL has second highest debt equity ratio. It is seen that SBL SD has 17.11% and CV has 70.98%. SBL highest average debt equity ratio and highest risk which is presented by standard deviation. Nabil bank has the highest CV which indicates the highest variation of debt equity. Debt equity ratio is fluctuated every year.

#### **Table 4.2 Total debt to assets ratio**

##### **4.1.2 Total debt assets ratio**

The debt -to-assets ratio measure how much of a business is owned by the creditors compared with how much of the company's assets are owned by shareholders.

<b>Fiscal year</b>	<b>Bank</b>			
	<b>CBL</b>	<b>SBL</b>	<b>NABIL BANK</b>	<b>MBL</b>
2010\11	0.00665	0.0179	0.0214	0.0257
2011/12	0.0140	0.02401	0.01458	0.0201
2012/13	0.010	0.01595	0.01645	0.02950
2013/14	0.01325	0.0214	0.02516	0.0510
2014/15	0.0802	0.0169	0.01034	0.0765
2015/16	0.0095	0.016022	0.00724	0.02840
2016/17	0.0094	0.05967	0.01037	0.019017
2017/18	0.0123	0.03134	0.0425	0.06544
2018/19	0.0169	0.01034	0.0765	0.0802
2019/20	0.01691	0.02540	0.01623	0.02134
Mean	0.0123	0.02325	0.027446	0.04188
S.D	0.0031	0.01873	0.02565	0.0260
C.V	0.254	0.80552	0.9348	.6223

*Source: Annual report of sampled banks*

**Figure 4.2***Total Debt Asset Ratios*

Table 4.2 and figure 4.2 shows the debt to assets ratio of selected commercial banks. In the each of the study MBL has highest debt to assets ratio as compared to other commercial banks, MBL has 0.0260 SD, 0.6223 CV and mean has 0.04188. Similarly, Nabil bank has second highest debt to assets ratio. Nabil bank has 0.02565 SD, CV has 0.9348 and mean has 0.27446. It seems that SBL has highest average debt to assets ratio and highest risk which is presented by standard deviation. Nabil bank has the highest C.V which indicates highest variation of debt to assets ratio.

#### 4.1.3 Bank size

Bank size measures the total assets of the bank. Total assets refer to the total amount of assets owned by a bank. It means sum of all current and long-term assets held by a bank.

**Table 4.3***Bank Size*

Fiscal year	Bank (natural logarithm of a number)			
	CBL	SBL	NABIL BANK	MBL
2010/11	24.5678	24.5570	23.9180	23.7941
2011/12	24.7189	24.74527	24.1120	23.9781
2012/13	24.8366	24.90899	24.2405	24.1180
2013/14	25.02177	24.9781	24.4203	24.2781
2014/15	25.1397	25.3199	24.6495	24.5427
2015/16	25.3270	25.4584	25.03276	24.7341
2016/17	25.3984	25.4812	25.2217	24.99165
2017/18	25.480	25.698	25.5096	25.1172
2018/19	25.6147	25.8595	25.760	25.396
2019/20	25.772	25.9437	25.9298	25.5822
Mean	25.1878	25.2951	24.8794	24.653
S.D	0.00827	0.4539	0.6784	0.3641
C.V	0.2085	0.0179	0.02726	0.01477

Source: annual report of sampled banks.

**Figure 4.3***Bank size*

Table 4.3 and figure 4.3 shows descriptive statistics- mean standard deviation, CV and size of firms associated with selected commercial banks for ten year period. According to table 4.3 in fiscal year 2019/20, Sunrise bank has the highest total assets scale in natural logarithm while Machhapuchree bank has lowest.

#### 4.1.4 Assets growth rate

Assets growth is defined as the Percentage of assets of current year minus assets of previous year divided by assets of current year. Assets are the economic resources of a company expected to benefit the firm's future operations.

**Table: 4.4**

*Assets growth rate*

Fiscal year	Bank (natural logarithm of a number)			
	CBL	SBL	NABIL	MBL
2010/11	24.7189	24.7452	24.1120	23.9781
2011/12	24.8366	24.9089	24.2405	24.1180
2012/13	25.0217	24.9780	24.4203	24.2781
2013/14	25.1397	25.3199	24.6995	24.5427
2014/15	22.9	25.4584	25.0327	22.4682
2015/16	25.327	25.4584	25.0327	24.7341
2016/17	25.3984	25.4812	25.2217	24.9916
2017/18	25.4808	25.6986	25.5096	25.1172
2018/19	25.6147	25.8595	25.7604	25.3960
2019/20	25.7723	25.9437	25.9298	25.5822
Mean	25.0211	25.3852	25.99096	24.5206
S.D	0.2578	.3822	0.3889	0.3976
C.V	0.010	0.0150	0.01556	0.01621

*Source: Annual report of sampled bank*

**Figure 4.4***Assets growth rate*

The table 4.4 and figure 4.4 shows the assets growth rate of sampled banks. According to the table 4.4 MBL the highest assets growth rate and the SBL has lowest and MBL has fluctuating assets growth rate. Nabil bank has the highest average assets growth rate and SBL bank has the second highest. It seems that Nabil has highest risk which is presented by standard deviation. MBL bank has highest CV that indicate MBL bank has highest variation among the sampled banks.

#### 4.1.5 Tangibility

Assets tangibility ratio shows the relationship of the total tangible assets of the bank to the portion owned by the shareholders and is as indicator of the level of the bank leverage.

**Table 4.5***Assets Tangibility ratio*

Fiscal year	Bank			
	CBL	SBL	NABIL	MBL
2010/11	0.02540	0.0099	0.0150	0.016342
2011/12	0.0240	0.0098	0.01246	0.01212
2012/13	0.0214	0.0096	0.01380	0.014685
2013/14	0.01797	0.0089	0.0111	0.013671
2014/15	0.01595	0.006345	0.0080	0.012037
2015/16	0.01925	0.0596	0.0085	0.01854
2016/17	0.02028	0.01427	0.0084	0.01619
2017/18	0.019085	0.01286	0.0089	0.01534
2018/19	0.01796	0.012441	0.0083	0.12579
2019/20	0.01547	0.011626	0.0077	0.01079
Mean	0.01968	0.01018	0.0102	0.0142
S.D	0.001725	0.002564	0.0008	0.0027
C.V	.087622	0.25183	0.0821	0.192

*Source: annual report of the sampled banks.***Figure 4.5***Tangibility ratio*

Table 4.5 and figure 4.5 shows descriptive statistic -mean, standard deviation, CV and mean of the asset's tangibility of Nepalese commercial banks. According to the table and figure, CBL has the highest tangibility ratio is 0.1 which indicate that in CBL total asset is greater than fixed assets and MBL has second highest tangibility ratio been 0.16. MBL has the highest CV that indicate MBL bank has highest variation among the observed banks.

#### 4.1.6 Return on assets

Return on assets measures the profit earned per dollar of assets and reflect how well bank management uses the bank's real investments resources test Create profits.

**Table 4.6**

*Return on assets*

Fiscal year	Bank (natural logarithm of a number)			
	CBL	SBL	NABIL	MBL
2010/11	1.76	1.91	1.76	1.28
2011/12	1.5	1.76	1.5	1.12
2012/13	1.48	1.54	1.48	1.43
2013/14	1.38	1.3	1.38	1.74
2014/15	1.04	1.21	1.04	1.51
2015/16	1.35	1.94	1.35	1.54
2016/17	1.52	2.09	1.52	1.59
2017/18	1.55	1.67	1.55	1.47
2018/19	1.66	2.21	1.66	1.18
2019/20	1.2	1.79	1.2	1.42
Mean	1.444	0.977	1.444	1.43
S.D	0.1621	0.4387	0.1621	0.1449
C.V	0.1122	0.4487	0.1122	0.101

*Source: Annual reports of sampled banks*

**Figure 4.6***Return on asset*

Table 4.6 and figure 4.6 shows mean, standard deviation, CV and return on assets associated with selected commercial banks for ten years period. According to the figure the SD of CBL has 0.1621, CV 0.1122 and mean 1.444. The table CBL has higher average return on assets in study period which indicates the Century bank has efficiently utilizing its total assets among the other banks.

#### 4.2 Presentation of statistical variables

Statistical tools are the mathematical techniques used to analyzed and interpret performance. It is used to describe the relationship between variables and interpret the results. This analysis includes Correlation coefficient and the regression coefficient between the following financial variables have been calculated and interpreted.

##### 4.2.1 Correlation analysis

Correlation analysis is used to assess the relationship between two variables. The correlation analysis results have been presented in Table 4.7

**Table 4.7***Correlation analysis*

	ROA	SIZE	TDA	TDE	GR	TAN
ROA	1					
SIZE	.181	1				
TDA	-.319*	.263	1			
TDE	-.318*	.197	.946**	1		
GR	-.018	.741**	.277	.237	1	
TAN	.109	-.173	-.242	-.309	-.161	1

*Source: SPSS output 25*

\*\* . Correlation is significant at the 0.01 level (2-tailed).

\* . Correlation is significant at the 0.05 level (2-tailed).

According to the table 4.7, the highest correlation has been observed to be 0.263 between TDE and TDE. The return on assets is positively correlated with the bank size, assets tangibility and negatively correlated with total debt to assets, total debt to equity and growth rate.

#### 4.2.2 Regression analysis

The regression analysis is carried out to determine whether the dependent variable is influence by the given independent variables or not.

#### 4.8 Variation in TDA explained by ROA, SIZE, GR & TANG

<b>Model Summary</b>				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.480 <sup>a</sup>	.231	.143	.0191743

a. Predictors: (Constant), TANGBLTY, ROA, GR, SIZE

*Source: appendix 1*

Table 4.8 shows of the model summary, which explains the total variation in TDA explain by ROA, SIZE, GR, & TANG. The value of coefficient of multiple determinations R square is 0.143 this implies that the variation of TDA can be explained by 14.3% independent variables at 95% confidence interval. The chance of error of estimate is i19.1743. in other words, finding the coefficient of multiple determination R square shows that 14.3% change in TDA of Nepalese commercial banks could be accounted to change in independent variables and remaining 85.7% are contributed by others factors. R is the correlation coefficient which shows the relationship between the study variables, from the findings shown in the table above

there was a highly significantly positive relation between the study variables as shown by 0.480<sup>a</sup>.

#### 4.9 Variation in TDE explained by ROA, SIZE, GR & TANG

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.472 <sup>a</sup>	.223	.134	.1911331

a. Predictors: (Constant), TANGBLTY, ROA, GR, SIZE

Source: appendix 4

As shown in table 4.9 of the model summary, which explains the total variation in TDE explain by ROA, SIZE, GR, & TANG. The value of coefficient of multiple determinations R square is 0.134 this implies that the variation of TDA can be explained by 13.4% independent variables at 95% confidence interval. The chance of error of estimate is 19.11331. in other words, finding the coefficient of multiple determination R square shows that 13.4% change in TDE of Nepalese commercial banks could be accounted to change in independent variables and remaining 86.6% are contributed by others factors. R is the correlation coefficient which shows the relationship between the study variables, from the findings shown in the table above there was a highly significantly positive relation between the study variables as shown by 0.472<sup>a</sup>. The table 4.10 below shows the analysis of variance (ANOVA).

#### 4.10 Goodness of fit of regression (ANOVA) for TDA

ANOVA <sup>s</sup>						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	.004	4	.001	2.624	.050 <sup>b</sup>
	Residual	.013	35	.000		
	Total	.017	39			

a. Dependent Variable: TDA

b. Predictors: (Constant), TANGBLTY, ROA, GR, SIZE

Source: appendix 2

From the ANOVA table 4.10 above, the processed data which is the population parameters, had a significance level of 0.05b% which shows that the data is ideal for making a conclusion on the population's parameters as the value of significant (p-

value) is equal to (5%). The Fisher's ratio i.e., the F-statistics) which is the proof of the validity of the estimated model as reflected in table.

#### 4.11 Goodness of fit of regression (ANOVA) for TDE.

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	.367	4	.092	2.512	.043
	Residual	1.279	35	.037		
	Total	1.646	39			

a. Dependent Variable: TDE

b. Predictors: (Constant), TANGBLTY, ROA, GR, SIZE

Source: appendix 5

From the ANOVA table 4.11 above, the processed data which is the population parameters, had a significance level of 0.043<sup>b</sup>% which shows that the data is ideal for making a conclusion on the population's parameters as the value of significant (p-value) is equal to (5%). The Fisher's ratio i.e., the F-statistics) which is the proof of the the validity of the estimated model as reflected in table.

The regression results for the independent effect of ROA, SIZE, GR, TANG on TDA & TDE (coefficients).

**Table 4.12 Regression results for independent effect of ROA, SIZE, GR& TANG on TDA.**

Model	B	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.197	.133		-1.483	.147
	ROA	-1.782	.799	-.349	-2.230	.032
	SIZE	.009	.008	.262	1.129	.267
	GR	.001	.006	.052	.228	.821
	TANGBLTY	-.655	.664	-.150	-.986	.331

a. Dependent Variable: TDA

Source: appendix 3

Table 4.12 shows that beta coefficients for return on assets are negative with total debt to total asset ratio. It indicates that return on assets has a negative impact on total debt to total asset ratio. This finding is consistent with the findings of Timilisina (2020). Similarly, the beta coefficients for bank size are negative with total debt to total asset ratio. It states that bank size has a negative impact on total debt to total asset ratio. This finding contradicts with the findings of the Chen (2004). Additionally, the beta coefficients for assets tangibility are negative with total debt to total asset ratio. It indicates that assets growth tangibility has a negative impact on total debt to total asset ratio

**Table 4.13 Regression results for independent effect of ROA, SIZE, GR & TNG on TDE.**

<b>Coefficients<sup>a</sup></b>						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-1.191	1.325		-.899	.375
	ROA	-16.174	7.968	-.319	-2.030	.050
	SIZE	.053	.080	.156	.666	.510
	GR	.021	.062	.079	.345	.732
	TANGLTY	-10.157	6.623	-.234	-1.534	.134

a. Dependent Variable: TDE

*Source: appendix 6*

Table 4.13 shows that beta coefficients for return on assets are negative with total debt to total equity ratio. It indicates that return on assets has a negative impact on total debt to total equity ratio. This finding is consistent with the findings of Timilisina (2020). Similarly, the beta coefficients for bank size are negative with total debt to total equity ratio. It states that bank size has a negative impact on total debt to total equity ratio. This finding contradicts with the findings of the Chen (2004). Additionally, the beta coefficients for assets tangibility are negative with total debt to total equity ratio. It indicates that assets growth tangibility has a negative impact on total debt to total equity ratio.

#### **4.14 Determinants of capital structure in Nepalese Commercial Bank**

##### **a. Bank size:**

Represent the largest group of depository institutions measured by asset size. Perform functions similar to those of savings institutions and credit unions - they accept deposits (liabilities) and make loans (assets) Liabilities include no deposit sources of funds such as subordinated notes and debentures Loans are broader in range, including consumer, commercial, international, and real estate Regulated separately from savings institutions and credit unions.

##### **b. Profitability:**

Profitability ratios are a class of financial metrics that are used to assess a business's ability to generate earnings relative to its revenue, operating cost, balance sheet assets, or shareholders' equity over time, using data from a specific point in time.

Profitability ratios can be compared with efficiency ratios, which consider how well a company uses its assets internally to generate income (as opposed to after-cost profits).

##### **c. Assets Tangibility:**

Tangible assets like property, plant, and equipment, used in a company's operations to produce a profit. These assets include anything with a physical nature that is used within a company.

##### **d. Growth Opportunities:**

The growth opportunity definition can be described as the chance to grow significantly. Whether that growth is in your career, personal life, or hobbies. Opportunities to grow are key to overall satisfaction and success. "The growth and development of people is the highest calling of leadership."

##### **e. Earning Volatility:**

Earning volatility is a statistical concept that determines the associated risk and helps predict the market price of particular stock .Volatility is the risk related to different degree of change in a security's value. Higher volatility implies higher risk.

##### **f. Tax:**

A tax is a compulsory financial charge or some other type of levy imposed on a taxpayer by a governmental organization in order to fund government spending and

various public expenditures. A failure to pay, along with evasion of or resistance to taxation, is punishable by law. A compulsory contribution to state revenue, levied by the government on workers' income and business profits, or added to the cost of some goods, services, and transaction.

#### **h. Inflation:**

Inflation is the decline of purchasing power of a given currency over time. A quantitative estimate of the rate at which the decline in purchasing power occurs can be reflected in the increase of an average price level of a basket of selected goods and services in an economy over some period of time. The rise in the general level of prices, often expressed as a percentage, means that a unit of currency effectively buys less than it did in prior periods.

Inflation can be contrasted with deflation, which occurs when the purchasing power of money increases and prices decline.

#### **4.3 Finding**

- i. According to the debt to assets ratio analysis SBL has highest average ratio i.e. 41.88% and CBL has lowest average ratio i.e.22.39%.
- ii. According to the tangibility analysis, CBL has a highest tangibility i.e. 19.68% which means MBL has highest fixed assets compared to other bank and CBL has lowest tangibility i.e. 10.18%
- iii. According to ROA analysis, CBL has highest ROA i.e. 1.44% and MBL has lowest ROA i.e. 0.977%
- iv. The coefficient of multiple determination of the equation is 0.143. This means the variable ROA, size, tangibility and growth rate is responsible for determining the total debt to assets by 14.3% and rest 85.7% are unexplained on determining the total debt to assets.
- v. The coefficient of multiple determination of the equation is 0.134. This means the variable ROA, size, tangibility and growth rate is responsible for determining the total debt to equity by 13.4% and rest 86.6% are unexplained on determining the total debt to equity.
- vi. The multiple regression shows that the beta coefficients for returns on assets are negative with total debt to total assets ratio. It indicates that the returns assets have a negative impact on total debt to total assets ratio.

- vii. The multiple regression shows that the beta coefficients for returns on equity are negative with total debt to total equity ratio. It indicates that the returns equity has a negative impact on total debt to total equity ratio.
- viii. According to the assets growth rate analysis, MBL has a highest degree of change in assets rather than other banks and Sunrise bank has lowest degree of change in assets.
- ix. According to the tangibility analysis, MBL has a highest tangibility i.e. 19.68% which means MBL has highest fixed assets compared to other bank and SBL has lowest tangibility i.e. 10.18%.
- x. From the correlation analysis the ROA is positively correlated with bank size and assets tangibility and negatively correlated with debt to asset, debt to equity and growth rate.

### **4.3 Discussion**

This study used descriptive and multiple regression analysis to examine the determinants affecting the capital structure of Nepalese commercial bank. Appropriate research methodology has been used. Secondary data were collected from annual reports of selected commercial banks. To obtain the results of the study different financial and statistical tools are used.

The result of return on assets having negative relationship with total debt to total assets is consistent with Timilsina (2020). This maybe because increase in return on assets leads to decrease in total debt to total assets.

Similarly, there is a positive relationship between bank size rate and total debt to total assets is consistent with Timilsina (2020). This maybe because higher bank size leads to increase in total debt to total assets.

Likewise, there is a positive relationship between tangibility and total debt to total assets is consistent with Timilsina (2020). This maybe because increase in assets tangibility leads to increase in total debt to assets.

Meanwhile, there is a negative relationship between assets growth and total debt to total assets is consistent with Timilsina (2020). This because higher assets growth rate leads to decrease in total debt to total assets.

The result return on assets has negative relationship between total debts to total equity consistent with Timilsina (2020). This maybe because ROA leads to decrease total debt to total equity.

Similarly, bank size has negatively related to total debt to equity consistent with timilsina (2020). This maybe because large bank size leads to decrease in total debt to total equity.

## **CHAPTER -V**

### **SUMMARY AND CONCLUSION**

This is the concluding chapter of this study. This chapter is divided into three sections; Summary, Conclusion and Recommendations. In this chapter, the study has been summarized in brief and some recommendations have been given which could be useful to stakeholders and to concern companies as well.

#### **5.1 Summary**

This chapter provides a brief summary of the entire body and highlights the major findings of the study. The objective of the study was to analyzed the determine of capital structure of Nepalese commercial banks. Chapter one gave a detailed background of the capital structure and objective of the study. This chapter also focused on the significance of the study, limitation and the organization of the study.

The basic objective of the study is to examine the determinants of capital structure between independent variables (ROA, size, tangibility, growth rate) of Nepalese commercial banks. The specific objectives of the study are (1) to analyze the impact of return on assets, size, tangibility, and growth rate on total debt to assets, (2) to analyze the impact of return on assets, size, tangibility, growth rate on total debt to equity.

Chapter two present the review of theoretical literature on capital structure. Different theories of capital structure are discussed on this chapter. So many international and national articles and thesis related on capital structure of commercial bank, manufacturing companies, and listed companies are also reviewed in this section. This chapter also focused on the critical review of major issues followed by the summary and gap to be filled by the study.

Chapter three was structured around research design, target population, sample design, data collections procedures and instruments, and data analysis and presentation. The sample comprised of 4 commercial banks (i.e. Century bank, Sunrise bank, Nabil bank, Machhapachre bank) from a total population of 27 commercial banks by using convenient sampling that met the eligibility criteria. To

achieve the objectives of the study descriptive and casual comparative research design has been employed.

Chapter four presented and discussed the results of empirical testing of determinants of capital structure of commercial banks. Data are analyzed by using appropriate financial, descriptive and analytical tools. In the analysis part, interpretation and comments are also made wherever necessary. Major finding of the study were also pointed out in this study.

## **5.2 Conclusion**

The study of factors affecting the share prices of commercial banks this study attempts to examine the determinants of capital structure in Nepalese commercial banks. The study is based on secondary data of 4 commercial banks with 40 observations for the period 2010/11 to 2019/20.

The study conclude that Bank size and assets tangibility have positive impact on total debt to total assets ratio whereas return on assets, assets growth have negative impact on total debt to total assets ratio. Likewise, return on assets, bank size, assets tangibility, assets growth has negative impact with total debt to total equity ratio. This study further concluded that return on assets, bank size and assets tangibility are the most influencing factors and assets growth is the least influencing factors affecting the capital structure of Nepalese commercial banks.

## **5.3 Implications**

This study also has several implications pointing to interesting avenues for future research. Some implications and suggestions for future research are discussed here.

### **5.3.1 General implication**

- i. This study examined the determinants of capital structure of commercial banks. The variables chosen were firm specific variables and may not be the only variables that determinants of capital structure. It is recommended that further research could be conducted to establish whether macro- economic variables determinants of capital structure.

- ii. This study has been conducted in the context of Nepalese commercial banks, with a short period of time and with small sample size. Future studies may deal with a wide area of firms with a long period of time.
- iii. There is a need to conduct an event study on determinants of capital structure on Nepalese commercial bank. Despite a lot of literature in this area independent variables like return on asset, bank size, tangibility and growth rate are vital elements of commercial banks.

### **5.3.2 Implications for future studies**

This study has portrayed some crucial results and one avenue for future research is to extend the study to other emerging banks.

- i. The study is entirely based on secondary data and does not include the preference of different investors and other stakeholders. Therefore, future studies can be based on using primary data or both primary and secondary data.
- ii. Finally, future studies can use some advanced statistical tools. For example, future studies can use non liner statistical tools.
- iii. The study is limited to Nepalese commercial banks. Therefore, the finding of this study could only be generalized to firms similar to those were included in this research.
- iv. This result is basically from "A" class financial institution of Nepal. Thus, the future study may incorporate other financial sectors such as development banks, insurance finance companies and micro finance companies.
- v. The study is limited to Nepalese commercial banks. Therefore the finding of this study could only generalized to firms.
