

THE IMPACT OF CLIMATE CHANGE ON RUNOFF GENERATION IN LANGTANG BASIN NEPAL

**Dissertation submitted to the Central Department of
Hydrology and Meteorology in partial fulfillment of the
Master's Degree of Science in Meteorology**

**By
Gopi Adhikari**

Fax No.: 977-1-4331964

Ref. No. :

Date:

Letter of Recommendation

This is to certify that Mr. Gopi Adhikari has prepared the dissertation entitled “**THE IMPACT OF CLIMATE CHANGE ON RUNOFF GENERATION IN LANGTANG BASIN**” to fulfill the partial requirement for the award of the degree of Master of Science in Meteorology of the Tribhuvan University. It is the record of the candidate’s own work carried by him under my supervision and guidance.

Dissertation Supervisor

ACKNOWLEDGEMENT

I would like to express my profound gratitude to **Mr.Tirtha Adhikari**, Associate professor, Department of Hydrology and Meteorology, Tribhuvan University for his constant supervision and guidance to accomplish this research.

I am thankful to **Prof. Dr. Lochan Prasad Devkota**, Head of the Central Department of Hydrology and Meteorology for his encouragement and support during the study period.

My sincere thanks goes to **Associate Professors Mr. Dipak Aryal, Dr. Binod Shakya, Mr. Tek Bahadur Chettri Lecturers Dr.Madan sigdel, Mr. Binod Dawadi and Assistant Lecturer Mr. Damodar Bagale, CDHM, TU** for their cooperation during the study period. I would also like to thank all the staff members of Central Department of Hydrology and Meteorology for their help and cooperation during the study period.

My sincere thanks go to my colleagues **Mr. Rameshwar, Mr. Niraj Shankar, Mrs Bibhuti, Mrs Indira and Mr. Binod** for their help and cooperation during the study period. And special thanks to **Mr. Harish Lekhak** for kindly support to complete this research.

I am grateful to DHM, for providing valuable data. Similarly, I acknowledge all the authors and writers, of whom the work is cited.

Finally, my sincere gratitude goes to my beloved parents and all my family members for their continuous support, due to which I could complete my work on time.

Gopi Adhikari

ABSTRACT

Climate change has potential impacts on economy, ecology, and environment of Himalayas. Climate change studies in Himalayan regions have focused mainly on glacier melting and retreating, Glacial Lake Outburst Flood (GLOF) etc. Changing temperature has direct impacts on glaciers and snow that affects the snowmelt and river discharge. Hence, this research has been carried out to understand the impact of climate change on runoff generation of Langtang basin. This runoff is important for planners and designers in the aspect of irrigation, hydropower, and drinking water supply and so on. So, the runoff estimation study is essential. This study is carried out using monthly Thornthwaite water balance model. Thornthwaite monthly water balance model is one of the popular model developed by USGS for the runoff estimation and can be applied to estimate the runoff of snow and glacier bound catchment. This study also focuses on the runoff estimation of past, present and future scenario at Langtang region of Nepal by using the Thornthwaite model. The outputs of the analysis on temperature trend revealed a faster warming trend in Langtang area (i.e. $0.084\text{ }^{\circ}\text{C}/\text{year}$). The mean annual soil moisture storage is increasing pattern (i.e. $0.71\text{mm}/\text{year}$). The precipitation and runoff are also observed increasing (i.e. $10.59\text{mm}/\text{year}$ and $0.8\text{mm}/\text{year}$). The coefficient of determination of calibration and validation are 0.926 and 0.996 that implies that the model is well validated and calibrated as well. The increase/decrease in temperature and runoff has proportional relationship and increase/decrease in rainfall and runoff has also proportional relationship. The projected runoff by the model is slightly decreasing from 2001 to 2060 this result shows that the chances of flood in summer and possible drought in winter may further enhanced in the future. The main outputs of this study help to implement appropriate strategy for water resources management and hydropower development and provide a strong message on the scenario of the Global impact of warming in the Himalayan region.

Keywords: Climate change, Thornthwaite, temperature, precipitation, runoff, Soil-moisture.
