ACKNOWLEDGEMENTS

This study has become valuable learning experience for me. I am grateful to all those who have directly or indirectly helped me to carry out the study and bring out this report.

This work has been completed successfully with the contribution of various people and organizations to whom I am deeply indebted. I would like to express my deepest gratitude to my supervisor, Lecturer Janardhan Thapa who has always been a source of inspiration and motivation to me to do better. He has guided and supported my research work closely since when I decided to work in this to the final documentation of the research. I am thankful to Prof.Dr.Biswo Kallyan Parajuli,Head of the Department for his support in conducting this research study.

My sincere thanks to all the respondents, without their support this research work would not had been completed. I would like to thank Mrs. Maya Subedi(President *Miruwatole Bikash Sastha*) and Mrs. Saraswati Khati (CAC member) for their cooperation during the interview schedule.

I want to remember and convey my gratitude to all those organizations, authors and researchers whose writings and findings have been incorporated for the preparation of this report.

I received continuous support from my colleagues during various stages of this work. I am grateful to my husband Mahesh Pandit for his continuous motivation and support during whole project. I would like to dedicate this piece of work to my family who has always supported me to carry out my education and this research project.

Sanju Poudel

ABSTRACT

This thesis work entitled “Decision Making on Use of Family Planning among the Married Women in Urban Area “was mainly conducted on the basis of primary data. The data were collected on the area of Pokhara Metropolitan City, Ward No. 2, Miruwa tole by scheduled interview and 132 samples were taken by non-probability convenience sampling method. The objectives of the study were to describe the knowledge and practice on the family planning and to analyze the decision making process on family planning by married women.

Family planning is hailed as one of the great public health achievements of the last century, and worldwide acceptance has risen to three-fifths of exposed couples. Good knowledge on family planning not only benefits women, it is beneficial to all their family and children. But women’s decision on family planning in male dominant geography like Nepal is limited to some extent. The study has assessed the different social factors like age, ethnicity, religion, education, income etc. that affects the decision making process of married women.

In this study, it was found that most the married women have not participated in the family planning awareness programs. Despite of that, they have good knowledge of family planning and the major sources of information are television, friends, husband and so on. The study found that husband gives positive responses on family planning methods after discussion and most of them like to use temporary FP methods.

The study found the correlation between women education and their decision making on household and family planning. Educated women are found to participate most of the household decisions and found to be associated with joint decisions on the use of family planning methods. The study also have assessed the decision making process in relation to occupation of the married women. Employed women are found to be more participated in the family household decisions. But in case of family planning, women with all occupation are similar on taking joint decision on use of FP methods.
