LETTER OF RECOMMENDATION

We hereby recommend that this thesis entitled **An Evaluation of Agroforestry as a Viable Base for Rural Development in Paanchkhaal VDC, Kabhre, Nepal** prepared by Mrs. **Amita Rajbhnadari** under our supervision be accepted by the Research Committee for the final examination in the fulfillment of the requirements for the degree of Master of Art in **Sociology**.

Approved by

Chairman

Mily Joshi
Research Advisor

Thesis Committee

ACKNOWLEDGMENTS

First of all, I would like to express my gratitude to my research advisor Lecturer. Ms. Millie Joshi for her guidance, advice, and support for this thesis. I sincerely acknowledge her contribution to this study.

I would also like to thank the people of Paanchkhaal VDC, without whose co-operation this study could not have been succeeded. I would also like to recognize the hard work of my husband Mr. Suman Kolachayapati during the field survey.

I would like to keep in record the appreciation to my lecturers and fellow students at the Central Department of Sociology who have made my study tenure at Tribhuvan University memorable and enjoyable. My special thanks go to staff members of CEAPRED and LGN.

Finally, I would like to thank my parents Mr. Rajkumar Rajbhandari and Mrs. Tejlaxmi Rajbhandari for their continued encouragement and inspiration throughout my life and the study period.

ABSTRACT

Agriculture and forestry are closely related with the livelihood of rural households of Nepal. It has been estimated that for sustaining 1 ha of agricultural land, 2.8 to 18 ha of forestland is required. Nepal is one of the few countries in the world where people to a large extent are dependent on agriculture and forest resources for their subsistence. Therefore, agroforestry is greatly needed because of its potentiality of generating farm household income, drudgery removal of women in household chores, increase active decision making role of women and leadership development in women, and reducing the pressure on community forests, thereby assisting rural development in Nepal.

This study on **An Evaluation of Agroforestry as a Viable Base for Rural Development in Paanchkhaal VDC of Kabhre, Nepal** focuses on the objectives: (i) to document the role of agroforestry systems in community forestry management of the study area, (ii) to identify the agroforestry system's major components that contribute to farm household income, (iii) to assess the impacts of agroforestry on drudgery removal of women in household chores, and (iv) to identify the role of agroforestry in active decision making of women, (v) to find the role of agroforestry in leadership development of women .

Whatever the definitions, agroforestry connotes using trees on farms. Rural development is a strategy to improve the economic and social life of specific group of people, the rural poor. The group includes small-scale farmer, tenants, and the landless. There are no legal aspects dealt with specifically in the context of agroforestry. Therefore, they are often directed from general forestry sector policy, act and regulation.

The research is conducted in three wards (3, 4, and 7) of the Paanchkhaal VDC of Kabhre, a central mid-hills district of Nepal. A total of 49 households are surveyed systematically. Household questionnaire survey, key informant interviews, direct observation and informal interviews are carried out for obtaining the data and related information. The secondary data and information are gathered from DDC, VDC, ISRSC and other organizations. Descriptive statistical tools like frequencies, percentages, means and standard derivations are used to present

the general findings of the study. Mostly tables, but graphical figures too, are used for describing the information.

The average household size is found slightly higher compared to the district and national average household sizes. The highest percentage of male and female population is found in 15-60 years age group. In all the tree categories (upper/lower/other) of caste, the average percent of distribution of households in the wards seems to be higher compared to the national average. The average total percent of literacy is slightly lower, compared to the national average percent. The average number of cattle and buffalos (together) per household is slightly greater compared to the national average.

The major source of income is of regular type, followed by business and labor. Agricultural crops, followed by milk, contributed the highest percentage of household income. A substantial household income is allocated directly or indirectly for NRM and CFM. A tremendous distance to be covered by the household to reach community forests seems to be reduced by the introduction of agroforestry development and community forestry management. The majority of the households reported that agroforestry reduced the passive decision making role of women to active decision making. Likewise, there is agroforestry directly proportional to the leadership development of the women in the study area.

CHAPTER I	1-5
INTRODUCTION	
1.1 Background	1
1.1.1 Situation of Agriculture and Forestry in Nepal	1
1.1.2 Agroforestry	2
1.2 Statement of the Problem	3
1.3 Scope of the Study	4
1.4 Objectives of the Study	5
1.5 Organization of the Thesis	5
CHAPTER II	6-15
REVIEW OF LITERATURE	
2.1 The Concept of Agroforestry	6-7
2.2 The Concept of Rural Development	8
2.3 Importance of Agroforestry Systems	9-10
2.4 Agroforestry and Household Income	11-12
2.5 Agroforestry and Household Workload	13
2.6 Agroforestry and Decision Making	13
2.7 Agroforestry and Leadership	14-15

CHAPTER III	16-20
METHODOLOGY	
3.1 Unit of the Analysis	16
3.2 Sampling Design	16
3.3 Research Instruments	17
3.4 Data Collection	18
3.4.1 Primary Data Collection	18
3.4.2 Secondary Data Collection	19
3.5 Data Analysis	19
3.6 Conceptual Framework	19
3.7 Limitation of the Study	20
CHAPTER IV	21-24
DESCRIPTION OF THE STUDY AREA	
4.1 District Background	21
4.2 The Area Under Study	22
4.2.1 Basic Geographic and Demographic Information	22
4.2.2 Climate and Vegetation	22
4.2.3 The Farming system	22
4.2.4 Community Forests	23
4.2.5 Development Activities	24
CHAPTER V	25-37
RESULTS AND DISCUSSIONS	
5.1 General Household Information	25
5.1.1 Household Characteristics	25
5.1.2 Ethnicity and Caste	26
5.1.3 Educational Status	27
5.1.4 Livestock Holding Size	28
5.2 Farm Household Income from Agroforestry	29
5.2.1 Sources of Income	29

5.2.2	Income from Different Products	30-31
5.3	Impacts of Agroforestry	32
5.3.1	Allocation of Income for Community Forests Management	33
5.3.2	Drudgery Removal and Utilization of the Spared Time	34
5.3.3	Minimization of Passive Decision Making	35
5.3.4	Leadership development of women	36-37
CHAPTER VI		38-41
CONCLUSIONS		
6.1	Conclusions	38-40

GLOSSARY

Allelopathic effects	Endogenous substances (kaolines) showing inhibitory effects on germination and growth of neighboring plants.
Alley cropping	synonymously used for hedgerow intercropping.
Bari	Upper slope, out sloping and rainfed terrace land.
Bole	The tree part, which is devoid of branches.
Boundary planting	Conventional agroforestry practices, where trees are planted on farm boundaries to demarcate the boundary.
Crown	The upper branchy part of the tree.
Khet	Lower slope, leveled and irrigated, terrace land.
Lalpurza	Official document (certificate) of land ownership
Non-farm income	Income from sources other than the agricultural activities.
Pakhobari	Synonymously used for bari.
Hedgerow intercropping	Agroforestry practices where arable crops are grown in the alleys between the rows of woody perennials.
Shelter belt	Several rows of trees for protecting soil.
Slash-and-burn	Cutting and burning of forests to clear the land and to provide ash 'fertilizer' or 'lime' for soil.

Strip hedgerow intercropping	Agroforestry practice, where tree rows are alternated with agro crops.
Wind break	Single or double rows of trees maintained for protecting soil, plants and livestock.
Woodlots	Strands of trees planted on farms, community lands or degraded land to provide wood for fuel, construction or pulp.
