

CHAPTER I

INTRODUCTION

1.1 Background of the study :

Industrial development is an important factor for achieving the basic objective of a country's economic and social betterment. It facilitates on effective mobilization of resource such as capital and skill, which might otherwise remain unutilized. It also acts as a vehicle for fostering innovation and technology improvement for industrial development, thus has a multiplier effect on the economy.

To get the rapid development of developing countries development in agriculture sector only is not sufficient. It is essential to develop the industrial sector too. Thus, industries have an important role to play in accelerating the rate of economic development. At certain stage of country's development, the highest returns may come from the production of particular types of manufactures, agricultural products or services. How to use resource at any time depends on market prospects and costs. So, the interesting question is not how fast a country can be industrialized, but how incentive policy, rules and regulation are designed so that new industries make maximum contribution to the country's development.

The starting industrialization in Nepal come to be very late, only after the Second World War. Industrialization is a comparatively new phenomenon in Nepal. Nepal is one of the least developing countries in the world, which is still in its crawling stage of industrial development. The sound economies development of any nation depends upon the higher rats of growing of production activities in the different sector of the country's economic. About four decades age, when the country was

under Rana rule for more than a hundred years no significant initiatives were taken to improve the economic condition. There were few Rana prime Ministers who had shown their interest in establishing some industries and public companies for the first time in the country. During the rule of Ranas, few industries were established, for example, Chandra Shams her J.B.R. had established means of “communication and rope-way transport”. Like wise, Buddha Shams her J.B.R. had established the first financial institution of Nepal, like Nepal Bank Ltd in 1994B.S. Morang Sugar mills Ltd. And Nepal Insurance & Transport Company Ltd in 2003 B.S. and 2004B.S. respectively.

After the Rana rule in 2007 B.S. and during the three decades of panchayat system in Nepal, a number of companies, industries and financial institution were established in the country. Democracy was restored in the country on B.S. 2046. After the HMG/N had adopted a liberalization economic policy in the country, and many industries were established as public and private companies.

Timely amendments in Industrial Policy Industry enterprise Act and economic polices have been made over the period of the years with a view to industrialize the country. Inadequate industrial base of the country, it has made imperative to identify new industrial sectors, which are instrumental to attract and mobilize local manpower, material and scattered capital of the country.

The well known fact is that in order to achieve security, stability and high standard of living, the country must be industrialized. But the industries sector of our country is facing many problems. Such problems arises due to the country being the land lock and underdeveloped, lack of trained and skilled manpower, financial resources, inconvenience in transport and communication networks, non availability of energy at

reasonable rate, shortage of capital, small size of the market, unawareness of the industrial potential, higher cost of production, low productivity of inputs, technology, instabilities in government policies etc. (Pradhan, 1994:181)

Now, Nepal has adopted the policy of economic liberalization and privatization and also got the membership of world trade organization (WTO) through the globalization. For strengthening the economy of any country both the private and public sector should play vital role. Now government is adopting foreign direct investment policy to encourage foreign investors. These policies create positive impact to the private manufacturing companies for industrial development. Due to the poor performance in term of capacity utilization, productivity, efficiency and profitability of Nepalese public sector manufacturing company needs to take competitive strategy, innovation, research and development. To be alive in competitive environment of globalization today, industries can sustain their existence and growth only through a continuous process of research and development on goods and services.

1.2 Introduction of Inventory Management

The literary meaning of the word inventory is stock of goods. Inventories are greatly influenced by the level of sales. Since inventories are acquired before sales can take place, and accurate sales forecast is critical to effective inventory management. Inventories generally represent the major element in the working capital of an organization and a very significant proportion of total assets.

Inventory is one of the most important assets to most of the organization. Larger percentage of total capital is invested in inventory. Inventory is vital element of the firms in the efforts to achieve desire

sales level. Inventory can be defined as a stock of any kind of items reserved in a store for a certain period. It constitutes the most significant portion of current assets. Inventories are stocks of finished product of a company or components that make up the product.

The various forms in which inventories exist in a manufacturing company are: raw material, work in progress, and finished goods. Raw materials are those basic inputs that are converted into finished product through the manufacturing process. Raw material inventories are those units, which have been purchased and store for future production. Work in progress inventories are semi-manufactured products. They represent product that need more work before they become-finished product for sale. Finished goods inventories are those completely manufactured products, which are ready for sale. Stock of raw material and work in progress facilitate production, while stock of finished goods is required for smooth marketing operation. Thus, inventories serve as a link between the production and consumption of goods.

Inventory management involves planning of the optimum level of inventory and control of inventory cost supported by an appropriate organization structure, which is staffed by trained persons and directed by top management. It involves both financial dimensions are interrelated and cannot be looked in isolation. (Agrawal, 2000:P238)

Inventory is the stock of materials or a product that frequently occurs in the manufacturing organization, depending upon the nature of industry and firm, inventories may be durable and perishable, valuable and inexpensive. When materials are purchased by an organization they have to be store until they are put into the production process. When the production is over the finished products have to be stored until they are

sold. In manufacturing there are four steps of inventories such as raw materials, work in process (semi manufactured product), finished goods and office supplies (Pandey, 2002:P755)

Thus the management should pay adequate attention to the inventory management to reduce the cost of production. Inventory should be maintained in appropriate quantity so as to avoid both under stock and over stock. The aim of inventory management is to maintain optimum level of inventory for the smooth production and sales. Therefore, inventory management is primarily concerned with minimizing total cost of inventory. Both the physical as well as financial dimension of inventory should be efficiently managed. Thus, the real task of top management lies in formulating the plan and policy that will lead to optimal inventory investment for the attainment of desired objectives.

To know the cost of inventory management, the manager should identify all the costs involved in purchasing and maintaining inventories. These costs are ordering cost and carrying costs.

Ordering costs: Ordering costs are the costs of placing and receiving an order. The cost of each order generally is fixed regardless of the average size of inventory. Total ordering cost (TOC) is the product of number of order (N) and fixed cost per order (O). Thus, $TOC=N \times O$.

Carrying costs: Carrying costs associated with inventory include the funds tied up, storage costs, insurance, and depreciation. The annual total carrying cost (TCC) is equal to the product of average inventory in units ($Q/2$), annual percentage carrying cost and price per units, and Thus, $TCC=Q/2 \times C$.

Total Inventory costs: Total inventory cost (TIC) is equal to the sum of total carrying cost and total ordering cost. Thus,
$$TIC = C \times Q/2 + O \times N$$

Similarly, inventory has direct relationship with profit planning to prepare different budgets, especially for the production budget and purchase budget because

Production Units = Sales Units + Closing Inventory – Opening inventory

Purchase Units = Production Units + Closing Inventory of raw materials – Opening inventory of raw material.

1.3 Introduction of J.K Soap & Chemicals Industries Pvt. Ltd.

The J.K Soap and Chemicals Industries Pvt. Ltd. is a manufacturing company which was established on 24th Falgun 2054 under the Company Act 2049. It had been started its production from the factory which was situated in Mangalapur, Rupandehi with initially authorized capital of Rs 35 crore thirty four lakh ninety eight thousand eight hundred and issued & paid up capital of Rs 4 crore thirty eight lakh. The main shareholders of this company are Ashok Kumar Kasaudhan and Satish Kasaudhan. The main objective for established this company is to provide the best quality product at a reasonable price all-round of the country.

J.K Soap Industries is employing 75 persons, has a plant with the capacity of producing 25 m. ton per day. Out of 75 persons, 10 are working in top level, 15 are in middle level and remaining persons are working in lower level. The company is producing different varieties of soaps. Basically it has classified its production in to three types. They are

laundry soap, detergent soap and bathing soap. Rupa 72%, Kiran, Gagan, Rupa washing powder and other bathing soaps are the main product of the company. These products are marketed the country, Nepal.

For the production of different types of soaps, different types of raw materials are used like palm acid oil, palm fatty acid oil, soap stone powder, salt, caustic soda and soap color. All these raw materials are imported from neighboring as well as other third countries like India, Malaysia, China and Australia. In the initial years of establishment, it had sold Rs. eighty lakh twenty thousand two hundred and thirty three value of soaps which increased to Rs. fifteen crore fifty eight lakh seventy six thousand nine hundred sixty seven and sixty three paisa value of soaps in the fiscal year 063/64.

For distributing the soaps all-round places of Nepal and increasing products sales, various dealers are available at different places like Pokhara, Narayangath, Kathmandu, Baglung, Surkhet, Nepalgunj, Biratnagar, Birgunj and Siraha. The company had given prime importance to its quality product for which it had established well equipped laboratory to assess the quality of raw materials as well as finished product.

1.4 Statement of the problem

Inventory is an essential element to the organization for generating profit. Generally inventory management covers from procurement of inventory to its distribution. So, how much to purchase? When to purchase? By which supplier should we purchase? How to purchase? We have to consider all these questions seriously. After procurement of inventories we must consider how they are well stored or maintain quality.

Inventory management has a significant role in manufacturing organization as well as service organization. In general, every business firm should keep the stock so that they can get them whenever they require. But both excessive and inadequate inventories are not desirable. The main aim of the inventory management is to maintain optimum level of inventory. The optimum level of inventory lies between two danger points of excessive and inadequate inventories. Excessive inventories indicate overinvestment which creates the problem of unnecessary tie up of the firms fund; excessive costs, the risk of liquidity and so on although it saves the cost on trade discount. Similarly inadequate inventories are also dangerous. Inadequate raw materials and work in process interrupts frequent production and insufficient finished goods do not meet the demand of customers regularly which is permanent to the firm because customers shift immediately to competitor's goods. Therefore, both have negative effect in profitability of the organization.

For the success of the unit inventory management takes important role because the cost of inventory directly affect the profitability of industry, but in Nepal least attention has been given to this important segment.

The research questions about the problem of the study are given below:

1. What kind of inventory management system is being followed by the J.K Soap & Chemicals Industries Pvt. Ltd?
2. What should be the optimum level of inventory to reduce inventory management cost?

3. What kinds of problem are faced by the J.K Soap and Chemicals Industries Pvt. Ltd. while conducting inventory management system?
4. What would be the impact of inventory management on the profitability of the company?

1.5 Objectives of the study

The main aim of the study is to identify the underlying constraints in existing inventory management and control system and their impact on the profitability of the J.K Soap and Chemicals Industries Pvt. Ltd. The major objectives of the study are given below:

- I. To examine the existing inventory management system followed by the J.K Soap & Chemicals Industries Pvt. Ltd.
- II. To analyze the techniques used by the company to determine level of inventory.
- III. To identify the optimum level of inventory to reduce inventory management cost.
- IV. To identify the inventories and their consequences on profitability of the J.K Soap & Chemicals Industries Pvt. Ltd.

1.5 Significance of the study

Inventory management is one of the most important functions in an organization. No any organization can achieve its goal without effective inventory management. Only effective inventory management can help organization to increase the profit. A little bit change in cost of inventory can bring a great change in the firm's profitability.

Inventory management is an important concern for all types of the business. Every business organization however big or small has to maintain some inventory. Inventory helps the company quickly responding to the customer demands which is an important element of competitive strategy. Inventories of finished off the correct items to meet the market at the different point of the time within a reasonable, response time play an important role in a company's ability to compete in the market. Inventories of raw materials or partially processed goods can help a company complete the production cycle in a much shorter time. Therefore, it is said that inventory for any organization is a necessary evil.

It is not hidden from anyone that most of Nepalese organizations are suffering from poor inventory management. It is rare case that a business can operate in the absence of inventories. In practice, it is usually found necessary to maintain inventories of raw material; semi finished goods and finished goods. It has already been started that inventory, plant capacity and labour can be regarded as inter changeable within limits. Generally this study is based on inventory management in J.K Soap & Chemicals Inds. The conclusion comes from this study will be useful to the J.K Soap & Chemicals Inds. as well as other print media. Other researcher will get benefit from this study.

1.6 Limitation of the study

Each research study has its own limitation. The study will have following limitations:

- (i) The study is concentrated on only the area of inventory management of J.K Soap & Chemicals Industries Pvt. Ltd.

- (ii) Since this is the case study, the conclusion derived from the study is not applicable in all types of organizations.
- (iii) This study covers only a period of seven years (2059/60 to 2065/66).
- (iv) The study is based on data provided from organization and other available resources. Hence this study is based on secondary data as well as primary data.
- (v) It's not a comparative study of similar nature undertaking.

1.7 Organization of the study

This study is divided into five different chapters which are given below:

a) Introduction

The first chapter consists of the introduction of the study, statement of the problem, objectives of the study, significance of the study, methodology used, limitation of the study and scheme of the study.

b. Review of literature

The second chapter can be divided into two parts. The first part is concerned with review of the concepts, theory of inventory management and framework from various books, journal and articles. The second part reviews previous related studies on inventory management.

c. Research Methodology

This chapter deals with research design, population and sample, nature and sources of data, data gathering procedure and tools and technologies used for gathering data.

d. Presentation and Analysis of data

This chapter consists of presentation and analysis of data used in the study. This is the main body of the study which is presentation in the tabular and other form. Major findings are drawn after analysis and presentation of the data.

e. Summary, Conclusion and Recommendation

This chapter consists of summary, conclusion and recommendation of the study.

CHAPTER II

REVIEW OF LITERATURE

This chapter deals with review of literature regarding inventory management. Only limited number of studies has been conducted in the field of the inventory management. But still the inventory management of J.K. Soap Industries Pvt. Ltd. has not been studied. Therefore the researcher is not able to find any literatures relating to this study. This chapter is mainly concerned with the conceptual framework and review of literatures.

2.1 Conceptual Framework

After the great depression of 1930s and before second Great world war the American economy as well as world economy was plagued by capacity utilization, material shortage, inflation and high interest rates. That situation made the managers of the organizations pay much attention in inventory. So the various concepts and techniques have been developed in this regard.

In this chapter, various terms, concepts and principles developed by the researchers have been defined as used in this investigation. The terms such as ordering cost, holding cost i.e. capital cost, operational cost (handling cost), spoilage & shortage cost, insurance cost & stock out cost under cost concept and economic order quantity (EOQ), ABC analysis, safety stock calculation, Re-order level calculation & techniques in inventory valuation under technical approach have been discussed in detail.

2.1.1 Inventory Management

The term inventory refers to assets, which will be sold in future in the normal course of business operations. The assets that the firm stores as inventory in anticipation of need are raw materials, work in process (semi finished goods) and finished products.

Inventory is an idle resource which is useable and has value. The idle resource may be man, material, plan requirement. Of course inventory is an item of current assets which is the most important for the successful run of any enterprise whether it is commercial or manufacturing. Mainly raw material, semi-finished goods, finished products and parts and supplies are the forms of inventory (Ahuja: 1993: P310).

Raw material inventory provides flexibility in the purchasing of raw materials. It is necessary to buy raw materials in line with its production schedule. Conversely, raw materials inventory may be bloated temporarily because the purchasing department may take the advantage of quantity discounts. The level of raw materials inventories will be influenced by anticipated production, seasonality of production, reliability of sources of supply and the efficiency of scheduling purchase and production operations. Example of raw materials is flour for Bread Company, sugar for sweet industries etc.

A manufacturing company must maintain a certain amount of inventory during the production, the inventory is known as work in process. Work in process is materials they have been partly fabricated but are not yet completed. Work in process inventory is strongly influenced by the length of the production period, which is the time between placing the raw materials in production and obtaining the

finished product. Decreasing the production period can increase inventory turnover. One means to accomplishing this is a new technique such as just-in-time inventory management. Another means is to buy items rather than make them.

Finished goods inventory allows the firm flexibility in its production scheduling and its marketing. The level of finished goods inventory is a matter of co-ordination of production and sales. The financial manager can stimulate sales by changing credit terms or by granting credit to marginal risks. But whether the goods remain on the books as inventories or as receivables the financial manager has to finance them. Many times, firms find it desirable to make the sale so that they are on a step nearer to realizing cash.

Inventory of parts and supplies includes spare parts such as bolt, nut, oil, lubricants, grease etc. these materials do not enter directly to the production but are most necessary for the production. Usually, these parts and supplies are small part of the total inventory and do not involve significant investment.

Any sort of item that a firm kept in meeting the future requirement of production and sale is called inventory. The basic reason for holding inventory is to keep up the production activities unhampered. It is neither physically possible nor economically justifiable to wait for the stocks to arrive at the time when they are actually required. Therefore, keeping of inventory is must for the efficient working of business unit (Jain and Narang: 1994: P109).

The term “Inventory Management” is composed of two different words ‘inventory’ and ‘management’. Inventory is the stock of materials hold by a firm to meet its future requirement of production

and sale. In other words, inventory refers to any stock hold by a company for smooth running of production and market operation. It is a kind of current assets in which huge part of working capital is invested. Therefore, inventory is essential for smooth running of manufacturing as well as trading firms. Lack of inventory affects not only the continuous production of goods but also affects smooth supply of finished goods. A manufacturing company generally holds four kinds of inventories namely, raw materials, work in process, finished goods and spare parts and supplies. The need of inventories is for the transaction motive, precautionary motive and speculative motive.

Management is an art, which is devoted for planning, directing, co-ordinating and controlling different activities to achieve the predetermined goal. Thus, inventory management can be defined as the planning, directing, co-ordinating and controlling of various activities which are concerned with inventory management.

Capital investment is required for the holding of different kinds of inventories. Excessive inventory increases the capital investment and inadequate inventory causes the obstacle in smooth running of production and market operation. So, excessive and inadequate is not desirable. Inventory should be maintained in appropriate level so as to avoid both under and over stock situation. Thus, main aim of inventory management is to avoid excessive and inadequate level of inventories and to maintain optimum level of inventory for the smooth production and sales operation.

Therefore, inventory management is mainly concerned with minimizing investment on inventory on one hand and minimizing cost of inventory management on other hand. Both physical

as well as financial dimensions of inventory should be managed effectively. The main duty of top level management is formulating plan and policies that will be helpful to maintain optimum level of inventory investment for achievement of desired goal.

Generally inventory management covers the function of:

- i. Purchasing
- ii. Store keeping
- iii. Issuing and pricing

2.1.1.2 Purchasing

Purchasing to a manufacturing company is of extreme importance because it has its own bearing on every vital factor concerning to the manufacture i.e. quantity, quality, efficiency, economy, prompt delivery, volume of production etc. it is the scientific purchasing that can save much money, time and efforts of the management.

In manufacturing company ‘ purchasing is the procuring of materials, supplies, machines, tools and services required for the equipment maintenance and operation of the business,’ Purchasing must be of the right quality in proper quantity delivering at the right time at the most favorable price from outside company.

In the words of industrial matter ‘purchasing is the procurement by purchase of Alfred and Beauty. Principles of industrial the proper materials, machinery, equipment and supplies of stores used in the manufacture of a product adopted to marketing in proper quantity and quality at the proper time and the lowest price consistently with the quality desired.’

In simple words, the task of purchasing is related to going the open market finding the desired materials at the lowest possible price and selecting the supplier who offers it at that price taking the quality of the materials in mind.

2.1.1.3 a Objectives of purchasing

The major objectives of scientific purchasing may be stated as follows:

- a. Procurement of required quality and quantity of materials at the best price not necessarily at the lowest price
- b. Procurement of materials which best suit the product and the purposes for which they are intended
- c. Purchasing for time utility by schedule, sufficiently in advance of the demands of the production department so that the production work shall not suffer due to lack of raw materials
- d. Buying the quality, which is neither too much that involves belonging of the capital nor too little that holds up the regular supply for production
- e. Improvement of the product with reference to quality and distribution by means of selection of adequate materials
- f. Maintaining continue supply to ensure production schedule at a minimum investment
- g. Avoidance of duplication of materials, leading to waste of materials and equipment
- h. Maintenance of company competitive position in the market by having company's quality standards in accordance with the demands of the consumers

- i. Creation of goodwill for the company through dealings with supplies
- j. Developing fullest co-operation and co-ordination maintaining internal relationship among various departments of the company.

2.1.1.3 b Purchasing procedures

The main steps in purchasing procedure may be listed as follows:

- i. Purchase requisition: The initiation of purchase begins with the formal request from the various sections or department to the purchase department to order goods. The request is made in purchase department by the departments needing the goods authorizing the purchase department for procuring the goods as per specification given in the slip by mentioning date on it.
- ii. Decision of purchase: On receipt of the purchase requisition, the purchase department the decides what and how much to buy taking into consideration of various limitations and constraints in purchasing the goods. As far as possible the raw materials or plant and equipment, the necessary permission should be taken from the authority concerned and the finance department to release the fund.
- iii. Study of market condition and sources of supply: Having taking the decision for the purchase of materials, the purchasing agent should study the market condition on the basis of market reports as to when and what goods should be purchased. An intensive study should also be purchased. An intensive study should also be made in regard to the source of supply from where the goods can be procured with the help of catalogues, directories, old records, pricelists of vendor and purchase records etc.

- iv. Selection of vendors: On the basis of the studies of market conditions and sources of supplier the purchasing agent selects the vendor keeping in mind the reliability, his price movement history, his delivery record and other service required and his past co-operation. Sometimes supplier is selected out of the list of suppliers registered with the company for the supply of goods or sometimes quotations or price bids or tenders are invited from the prospective suppliers. Through the study of supply and the quality and quantity of goods, a vendor is selected out of the bidders or tenderizer.
- v. Purchase order: After selecting the vendor, a purchase order is prepared in the prescribed form by the purchase department and sent to the vendor authorizing to supply specified quantity of quality of materials at the stipulated terms, at the time and place mentioned therein. It forms a formal contract between the purchase and the vendor.
- vi. Receiving materials: When goods arrive they are taken delivery and time receiving clerk checks material with the order placed by the purchasing department to the vendor. After proper checking, goods should be delivered to the store department or to other department that requisitioned them. On checking if any discrepancy is found as regards to quality or quantity, it should be referred to the purchasing department so that discrepancy may be adjusted.

2.1.1.4 Store keeping

Materials form a high percentage of the cost of production of product. It is therefore necessary to have a close watch in the proper use

of the materials. The best method of maintaining materials properly is store keeping. Store keeping is a service function in a manufacturing concern, which deals with the physical storage of goods under the custodian of well-trained and experienced person termed as storekeeper. Raw materials are usually known as stores and the place where such stores are kept is known as storeroom. Store keeping is that aspect of inventory control, which is concerned with the physical storage of goods. The responsibilities of store keeping management are to receive materials to protect them in storage from the materials in the right quantities at the right time to the right place and provide these services promptly and at least cost (Maynard ,1992 : P90).

Storekeeping should be given due place in the organization otherwise the material handling will add to the cost of production. The importance of store keeping has not been properly recognized by the manufacturing organization so far. Many organizations spend lavishly on machines and wages while store keeping is ignored and stores are housed in camped quarters, ill equipped and ill ventilated. Storekeepers are also ill paid in comparison to others in similar status. All these caused are responsible for wrong of short issue. Loss of stock of raw materials, unexpectedly running out of stock and preparation or incorrect vouchers all these lead to theft and pilferage of stock and delay in production.

In the light of the above explanation storekeeping can be described as the keeping of materials in stores in a scientific and systematic way.

2.1.1.5 a Objectives of store keeping

- i. Receiving, handling and issuing goods economically and efficiently
- ii. Using the storage available space and labor effectively

- iii. Protection of all goods in stores against all losses from fires, theft and obsolescence
- iv. Minimizing the investment on inventories
- v. Maintaining regular supply of raw materials at all times when properly authorized
- vi. Facilitating regular supply of raw materials at all times when properly authorized
- vii. Facilitating ordering of required materials
- viii. Minimizing the inventory holding cost

To achieve the above objectives a firm generally uses different types of controlling devices.

a. Bin cards: A bin card makes a record of the receipts and issue of materials and is kept for each item of stores carried. The storekeepers maintain these cards and he himself is responsible for any difference between the physical stock and the balance shown in the bin card. These cards are used not only for recording receipts and issues of stores but also assist the storekeeper to control the stock.

For each item of store, minimum quantity, maximum quantity and ordering quantity are stated on the card. By seeing the bin card the storekeeper can send the material requisition for the purchase of material in time.

b. Store Ledger: This ledger is kept in the costing department and is identical with the bin card except that receipts issues and balances are shown along with their money values. This contains an account for every item of stores and makes a record of the receipts, issues and the balances,

both in quantity and value. Thus, this ledger provides the information for the pricing of materials issued and the money value of any item of each item of stores (Jain and Narang: 1991: P 237-239).

2.1.1.6 Issuing and pricing

Materials should be issued against materials requisition slip. The prices of the issues can be determined on the basis of cost price or market price.

2.1.2 Objectives of inventory management

Main objectives of inventory management are:

- a. To maintain large size of inventory for efficient and smooth production and sales
- b. To maintain a minimum investment in inventories to maximize profitability.

To achieve the above objectives inventory management should perform following functions.

- i. Continuous supply of raw material without obstruction for smooth production operation
- ii. Provide enough raw material to cope with the situation when there is lack of raw material supply and price change in future
- iii. Maintain enough finished goods inventory for effective market operation and customer service
- iv. To minimize carrying cost and time

v. To control investment inventories and maintain optimum level.

2.1.3 Classification of cost

Cost is certainly a considerable factor in purchasing, production and maintaining inventory. To solve cost problem, the decision factors are when to purchase and how much to purchase at a time. The various factors should be composed and are applied to use the mathematical techniques in order to get the optimum and ideal inventory management system to bring the least cost consequence to the company. Lack of adequate knowledge regarding inventory policies to production manager and absence of formal records derives critical situation for economy purchase.

The principle cost involved in maintaining inventory can be classified as:

i. Holding cost / carrying cost

Cost incurred for maintaining a given level of inventory is called carrying cost. Carrying cost varies with inventory size. This behavior is contrary to that ordering cost which decline with increase inventory size. (Bishwakarma:1994: P 39)

The carrying cost includes the cost incurred in the following activities

- a) Opportunity cost or cost of capital
- b) Warehousing cost
- c) Handling cost
- d) Clerical and staff

e) Insurance and taxes

f) Deteoriation and obsolesce

Carrying cost is the first category of inventory management cost which is generally associated proportionally with the average value of inventory.

The total carrying cost is calculated as follows

$$\text{Total carrying cost (TCC)} = (C\%) (P) (AI)$$

Where,

C%= Percentage of cost of carrying inventory which is calculated by adding the cost of capital tied up, storage, insurance and taxes etc. and dividing it by the average inventory value.

P= Price per unit of inventory

AI= Average inventory in units i.e. order quantity (Q) divided by two plus safety stock (S) if any, assuming a constant rate of consumption of inventory.

$$AI = Q/2 + S$$

ii. **Ordering cost**

Ordering cost is the entire cost of acquiring raw material. Ordering cost increases with the number of order. Thus, more frequently is the inventory purchased, higher the firm's ordering cost? On the other hand, if the firm maintained large inventory levels there will be few order placed and ordering cost will be relatively small. Thus ordering cost decreases with increasing the size of inventory. Thus ordering cost decreases with increasing the size of inventory. The ordering cost includes the cost incurred in the following activities:

- a. Purchase requisition
- b. Purchase order
- c. Transportation

It is the second category of inventory maintenance cost. Generally this cost is fixed in nature with some exception. This cost involves both fixed and

variable costs, assuming the ordering cost (O) if fixed per order, the total ordering cost is calculated simply by multiplying 'o' by the number of times to be ordered per year. (Pradhan:1992:P181). Therefore, total ordering cost is calculated as follows

$$\begin{aligned} \text{Total ordering cost (TOC)} &= (O) (N) \\ &= (O) (R/Q) \end{aligned}$$

Where,

O = Cost of placing an order

N = Number of times to be ordered per year

R = Annual requirement

Q = Quantity per order, where quantity per order is equal

iii. Safety stock cost:

The third category of inventory cost is the cost of maintaining safety stock. At this point, it should be noted that (TCC) includes the cost of maintaining safety stock, if TCC is using average inventory (AI). In other words,

$$\text{TCC} = (C \%) (P) (AI)$$

Where,

C% = Percentage of cost of carrying inventory

P = Price per unit of inventory

AI = Average inventory

The cost of maintaining safety stock may be needed to calculate separately to account for the cost of maintaining safety stock for some other reasons. It is calculated simply by multiplying the carrying cost per unit by the safety stock.

Cost of safety stock (CSS) = (C %) (P) (S)

Now we can calculate the total cost of maintaining inventory (TCMI) by summing up all the cost. We can get TCMI by combining TCC, TOC and CSS(Pradhan: 1992:P 182).

TCMI = TCC + TOC + CSS or

TCMI = [(C %) (P) (AI)] + [(O) (N)] + [(C %) (P) (S)]

Where,

TCMI = Total cost of maintaining inventory

TCC = Total carrying cost

TOC = Total ordering cost

CSS = Cost of safety stock

C% = Percent of cost of carrying inventory

P = Price per unit of carrying inventory

AI = Average inventory

N = Number of orders made during the year

S = Safety stock

O = Cost of placing order.

2.1.4 Techniques of inventory management

In managing inventories the firm's objectives should be in consonance with the wealth maximization principle. To achieve this firm should determine the optimum level of inventory. Efficiently controlled inventories make the firm flexible. Inefficient inventory control results in unbalanced inventory and inflexibility. The firm may be sometimes out of stock and sometimes may pile unnecessary stocks, such situation increases the level of investment and makes the firm unprofitable.

To manage inventories efficiently answer to the following two questions should be sought:

- i. How much should be ordered?
- ii. When should be ordered?

The first question how much to order, relates to the problem of determining Economic Order Quantity (EOQ) and is answered by analyzing cost of maintaining various levels of inventories. The second question when to order arises because of uncertainty with replenishing time and is a problem of determining the reorder level. (Pandey:1989: P395)

2.1.5 Economic Order Quantity

The question of how much to be ordered can be solved by the EOQ technique. It always tries to balance the ordering cost and handling costs.

In other words, it suggests to the management to order those quantity which would least expensive.

This inventory control technique is widely used these days in many countries irrespective of developed or developing nature. This model determines the optimal order quantity of an individual item of inventory given its forecasted wage, ordering cost and carrying cost (Pandey: 1989:P395).

2.1.6 Ordering and carrying cost

The optimum inventory size is commonly referred to as economic order quantity. It is that size at which annual total cost of ordering and holding are the minimum. We can follow three approaches- the formula approach, trial and error approach and graphic approach to determine the economic order quantity (EOQ). We assume the total annual demand is known with certainty and usage of material is steady. Also ordering cost per order and cost per unit are to be constant (Panday:1993:P759).

To determine EOQ, different approaches have been illustrated below respectively.

2.1.7 Formula Approach

$$EOQ = \sqrt{\frac{2RO}{C}}$$

Where,

EOQ = Economic Order Quantity

R = Annual Requirement

O = Ordering cost per order

C = Carrying cost per unit

Illustration

Total requirement (R) = 2000 units

Ordering cost (O) = Rs 80 per order

Carrying cost (C) = Rs 2 per unit

We have,

$$\begin{aligned} EOQ &= \sqrt{\frac{2RO}{C}} \\ &= \sqrt{\frac{2 \times 2000 \times 80}{2}} \\ &= 400 \text{ units} \end{aligned}$$

2.1.8 Trial and Error Approach:

The trial and error or analytical approach to resolve the order quantity problem can be illustrated with the help of simple example:

Total annual requirement (R) = 2000 units

Carrying cost (C) = Rs 80 per order

Ordering cost (O) = Rs 2 per unit

Economic order quantity (EOQ) = ?

Table 2.1

Total cost of various orders

1	No of orders	1	2	4	5	8	10
2	Order size	2000	1000	500	400	250	200
3	Average inventory	1000	500	250	200	125	100
4	Ordering cost(Rs)	60	120	240	300	480	600
5	Carrying cost(Rs)	2000	1000	500	400	250	200
6	Total cost	2060	1120	740	700	730	800

On the above table 400 units is the economic order quantity where the total cost is least i.e. Rs700.

Where,

$$\text{No. of order} = R/Q$$

$$\text{Order size} = R/\text{no. of order}$$

$$\text{Average inventory} = \text{order size} / 2$$

$$\text{Carrying cost} = \text{CCPU} \times \text{Average inventory}$$

$$\text{Ordering cost} = \text{No. of order} \times \text{ordering cost per order}$$

$$\text{Total cost} = \text{Ordering cost} + \text{carrying cost}$$

2.3 Graphic Approach

Total ordering cost curve is increased with the no. of orders increase but it reduces the carrying cost and vice versa. The point where the total cost curve is minimized represents the EOQ.

Figure 2.1

The above figure clearly shows the general behavior of carrying cost, ordering cost and total cost. The total cost line represents the sum of the ordering cost and carrying cost for each order quantity. The minimum total cost occurs at point Q where total carrying cost equals the total ordering cost. These two costs react in opposite to each other for the changes in order size. As the order size goes on decreasing, the total carrying cost also decreases but the total ordering costs goes on increasing with this. The opposite occurs when order quantity increases.

2.3.1. Important assumption of Economic Order Quantity Model

Although EOQ is easier technique to solve the problem of how much to purchase at once but it has some limitations/ assumptions which are as follows(Elwoods:1990:P150)

- i. Average demands of materials are continuous and constant.
- ii. The lead time is constant. Although this assumption may be valid in many situations, however lead times are often variable. The result of a variable lead time is that receipt of the order produces excess inventories when lead times are shorter than expected and stocks out situations when lead times are longer than expected. The basic model is not appropriate when lead times are variable. Further the deliveries for all 'Q' items are instantaneous rather than over time.
- iii. Independence between inventory items: The EOQ Model assumes that replenishment of one inventory item has no effect on the replenishment and any other inventory item. This assumption is valid items are coupled together by a common production plan.
- iv. Purchase price and price parameter are constant.
- v. The ordering quantity (EOQ) should be equal to the delivery quantities. If delivers lost are smaller than the average inventories in the EOQ the model is no longer remain valid.

2.3.2 Always Better Control (ABC) Analysis (Pandey: 1994:P406-407)

Most of the organizations have different types of inventories at a time. All the inventories do not have identical value and all the inventories can not be treated and controlled using equal management. So

management has to pay attention according to their values. For this, ABC technique has been developed.

This ABC technique has been developed on the basis of 'Thick on the best and thin on the rest'. Under the ABC system materials are classified into three categories: A, B & C. The high value items are classified as 'A' items, least value items are classified as 'C' items and 'B' items fall in between these two categories. The ABC analysis concentrates on important items and is also known as control by importance and exception. As the items are classified in the importance of their relative value, this approach is also known as proportional value analysis.

The following steps are involved in implementing the ABC analysis:

- a) Classify the items of inventories, determining the expected use in units and the price per unit for each unit.
- b) Determine the total value of each item by multiplying the expected units by its unit price.
- c) Rank the items in accordance with the total value, giving first rank to the item with highest total value and so on.
- d) Complete the ratios (percentages) of number of units of each item to total units of all items and the ratio of total value of each item to total value of all items.
- e) Combine items on the basis of their relative value to form three categories A, B & C.

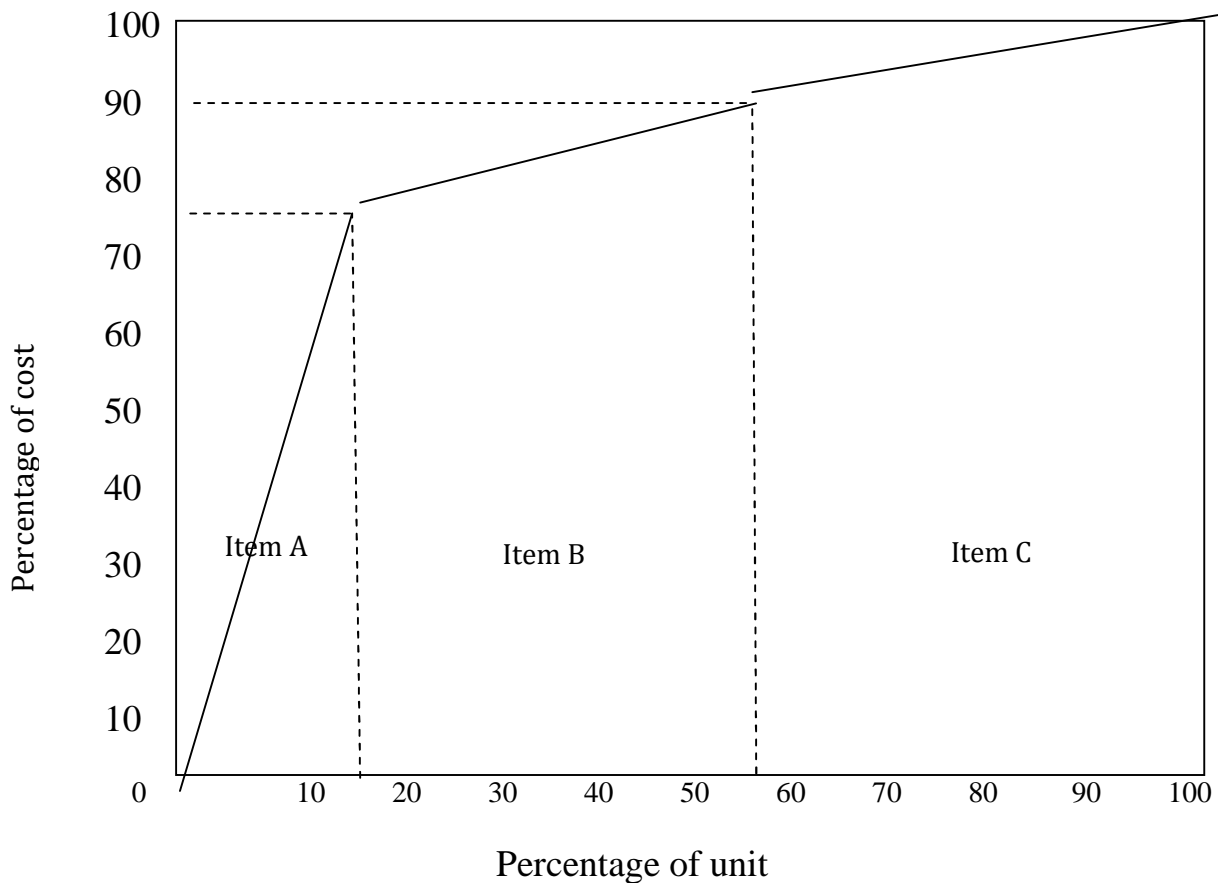

The proportion of category A generally is 10-15% of total units of all items but represents the highest value 70%. On the other hand, item 'C' represents 55% of the total units and only 10% of the total value. Item 'B' occupies the middle place. Item 'A' & 'B' jointly represent 45%

of the total units and 90% of the investment. More than half of the total units are item 'C' representing merely 10% of the investment.

The significance of this analysis is that a very close control is exercised over the items of 'A' group which account for a high percentage (70%) of cost while less stringent control is adequate for category 'B' and very little control would be sufficient for category 'C' items.

Figure II

Graphic presentation of ABC Analysis

Control for class 'A' items: Close control is required for inventory items that have high stock out cost & those items that account for a large fraction of the total inventory value. The closes control might be reserved for raw materials that are used continuously in extremely high volume. Purchasing agents may arrange contracts with vendors for the continuous

supply of these materials at desired rates. In such instances the purchase of raw materials is not guided by either economical quantities or cycles changes in the rate of flow are made periodically as demand & inventory position changes. Minimum supplies are maintained to guard against demand fluctuations & possible interventions of supply.

For the balance of class 'A' items periodic ordering, perhaps in a weekly basis provides the necessary close surveillance over inventory levels variations is usage rate are observed quickly by the size of each weekly order according to the periodic system or optimum system. Also because of the close surveillance, the risk of a stock out is small. Nevertheless, buffer stocks that provide excellent service level will be justified for items having large stock out costs.

Control for class 'B' items: These items should be monitored and controlled by a computer based system with periodic reviews by the management. Many of the models discussed in this chapter are relevant for these items. However model parameters are reviewed less often than with class.

Control for class 'C' items: Class 'C' items account for the great bulk of inventory items and carefully designed but routine controls should be adequate. A re-order point system does not require a physical stock evaluation. Such as the two bin systems will ordinarily sufficient. For item action is triggered when inventories fall to the re-order point. If usage changes order will be triggered earlier or later than average, providing the needed compensation semi annual review of the system parameters should be performed to update usage rates, estimates of supply lead times & costs that might result in changes in EOQ. A periodic review at a long interval can also be used (Richardmond: 1969:P396).

2.3.3 Advantages of ABC Analysis (Jain and Narang: 1995:P243-244)

1. A strict control is exercised on the items, which represent a high percentage of the material costs. Managerial time is spent on 'A' items whereas 'C' items and sometimes 'B' items can be handled by clerical staff with least managerial supervision. Equal attention to all the items of stores is not desirable because it is expensive.
2. Investment in inventory is reduced to the minimum possible level because a reasonable quantity of 'A' items representing a significant portion of the material costs is purchased to reduce investment in materials, close control of 'A' items contribute much more than close control of 'C' items.
3. Storage cost is reduced as a reasonable quantity of materials, which account for high percentage of value of consumption, will be maintained in the stores.

2.3.4 Safety Stock Calculation

The proper amount of safety stock to maintain depends on several things. The greater the uncertainty associated with forecasted demand for inventory the greater the safety stock of the firm will wish to carry, all other things remaining the same. Similarly, the greater the uncertainty of lead time to replenish stock, the greater the risk of running all of stock and the more safety stock the firm will wish to maintain all other things being equal. Another factor influencing the safety stock decision is the cost of running out of inventory. The company being out of raw material and inventories results delay in production. How much does it cost? When production closes down temporarily? And where fixed costs are high this cost will also be quite high? The cost of running out of finished goods is customer dissatisfaction. It is because of low quality, no regular supply of goods & high price. It not only will lose immediate sale but

also endanger the future sale, if customers take their business elsewhere. Although this opportunity cost is difficult to measure, it must be recognized by management & should incorporate into the safety stock decision. The greater the cost of running out of stock, the greater the safety stock will be wished to maintain, all other things being the same.

The cost of carrying additional inventory is very costly to the firm. If it was not the case a firm could maintain whatever safety stock it required to avoid all possibility of running out of inventory. The greater the cost of carrying inventory the more costly it is to maintain a safety stock, all other things being equal. Determination of the proper amount of safety stock involves balancing the probability & cost of a stock out against the cost of carrying enough safety stock to avoid this possibility. Ultimately the question reduces to the probability of inventory stock out management is willing to tolerate (Vanhorne:1990:P449).

Safety stock can be determined using statistical methods in different situations.

1. on the situation when demand rate varies:

Safety stock = Lead time (Maximum demand rate – Average demand rate)

2. On the situation when both demand rate and lead time fluctuate:

Safety stock = (Maximum lead time x Max. demand rate) –
(Average lead time x average demand rate)

3. On the situation lead time varies demand uniform:

Safety stock = (Maximum lead time – Average lead time) x demand rate

2.3.5 Re-order Point Calculation

The problem how much to order is solved by determining the economic order quantity (EOQ) but the second problem when to order is solved by determining reorder point.

If order is placed when the stocks are over then there is always a chance that the firm may face the situation of storage. Another alternative is to place an order before the stock is completely exhausted i.e. to order in advance. Again to determine the appropriate time when the order should be placed in advance is a difficult exercise. If an order is placed too early then it may result in piling up of inventory for the longer period and if it is placed too late then this may result in shortages. Both these situations are not in the interest of the firm. The problem is known as 'when to order' & is very difficult for any organization. In other words, the choice of appropriate point at which an order to replenish the inventory at which re-order should be placed is known as re-order level or re-order point (Goel: 1990: P294).

Three items of information are needed input to determine the re-order point subsystems which are given below:

- ❖ Usage rate: This is the rate per day at which the items are consumed in production or they are sold to customers.
- ❖ Lead time: This is length of time between placing an order & receiving the goods.
- ❖ Safety stock level: This minimum level of inventory may be expressed in terms of several days' production and sales.

Safety stock is necessary for an uncertain demand of the customers. The demand for goods may fluctuate day by day or from week to week, if the actual usage or sales go up & delivery of goods is delayed. The provision of safety stock makes the organization able to face the problem of stock out. Hence, re-order point is calculated as follows:

Re-order point = Lead time x Average usage + Safety stock

2.3.6 Determining critical levels

Maximum stock level (Jain and Narang :1995: P231)

This represents the maximum quantity of an item of material which can be held in stock at any time. Stock should not exceed than this level at any cost. The quantity is fixed so that there may be no over stocking. Over stocking should be avoided because of the following disadvantages:

- a. Overstocking of materials unnecessarily blocks working capital which could be profitable lying unutilized somewhere else.
- b. Overstocking of materials will need more go down space so more rent will have to be paid.
- c. There may be loss due to obsolesce on account of overstocking.
- d. There are chances of deterioration in quality because large stocks will require more time before they are consumed.
- e. There may be fear of depreciation in market values of the overstocking of material.

The maximum stock level is fixed by taking into account the following factors:

- i.Amount of capital available for maintaining stores
- ii.Go-down space available
- iii.Rate of consumption of the material during the lead time
- iv.The time lag between indenting & receiving of the materials.
- v.Possibility of loss in stores by deterioration & evaporation
- vi.Cost of maintaining stores.

It can be calculated by following formula:

Maximum stock level = Re-order level + Re-order quantity – (Minimum usage x Minimum delivery time)

Minimum stock level (Jain and Narang: 1995: P231)

This presents the minimum quantity of the material which must be maintained in hand all times. The quantity is fixed so that production may not be held up due to shortage of the material. In fixing this level the following factors are taken into consideration:

- i. Lead time i.e. time lag between indenting and receiving of the material. It is the time required to replenish the supply.
- ii. Rate of consumption of material during the lead time.
- iii. Nature of material: Minimum level is not required in case of a special against customer specific order.

It can be calculated by following formula:

Minimum stock level = $ROL - (\text{Normal consumption} \times \text{Normal re-order period})$

Where,

$ROL = \text{Re-order level}$

$\text{Normal consumption} = \frac{\text{Maximum consumption} + \text{Min.cons.}}{2}$

$\text{Normal re-order period} = \frac{\text{Max. delivery period} + \text{Min. delivery period}}{2}$

Danger stock level

This represents a level at which normal issues of material be stopped and issues are made only under specific instruction. The purchases officer will make special arrangements to get the materials which reach at their danger levels. So that the production may not stop due to shortage of materials. Danger stock level can be calculated by following formula:

Danger stock level = Average consumption x Max. re-order period for emergency purchase

2.3.7 Inventory valuation

In any firm different goods are purchased at different time at different price rate. But the problem to assign value to these goods, emerged to identify the position of current assets of the firm. Balance sheets of the firm should show true and fair view of the financial position of the firm. For these purpose assets including inventory should be properly valued to exhibit a true and fair view. True profits cannot be calculated unless assets are properly valued.

The false valuation of the inventory directly affects the profit. If inventory is valued at a lower value than actual, the profit will decrease and as result shareholders would get fewer dividends. On the other hand, if inventory is valued more than actual value, the profit would be increased and the shareholders will receive more dividends, a part of which would then be paid out of capital to be insolvent. Moreover, under or over valuation of inventory will not only affect the appearing result these for the next period but will also affect these for the current period will become opening stock for the next period.

Valuation of inventories affects profit of the year. Therefore, method of valuation of inventory should not be changed year to year to enable comparison of profit of valuation of the inventory are as follows:

2.3.7.1 Specific Identification Method

This method requires that each unit in inventory to be identified with the particular time it be purchased. This is easiest when the items have serial number or are distinguishable by module, color or size because account must be able to identify the particular item in order to find the date of purchase. This is suited to low volume high cost item such as automobile, boat, fur-coat, jewelry etc.(Jain and Narang:1995: P262)

2.3.7.2 First In First Out (FIFO) Method

In this method the earlier lots of materials or goods purchased of goods manufactured are exhausted first and closing stock is out of the latest consignment received or goods manufacturing and is valued at the cost of such goods. In other words, cost of goods sold is calculated keeping in view the earliest lots exhausted on the presumption that units are sold in the order in which they were acquired. Similarly, the ending inventory is valued at the unit cost of most recent acquisitions, which means that the units assumed to be included in the cost of goods sold had been purchased earlier (Shrestha: 1980: P161-164).

2.3.7.3 Last In Last Out (LIFO) Method

As in first in first out method, latest consignments of materials are exhausted first under this method. Therefore, closing stock is valued at the cost of the earliest lot on the other hand the cost of goods sold is based on the cost of recently purchased goods (Jain and Narang:1991: P 264).

2.3.7.4 Weighted Average Cost of Capital (WACC)

This method assumes that goods are removed from the beginning inventory and purchase group in proportion to the number of units in these groups. This method is widely used by organization that holds items in inventory for long period of time. The price is obtained by the total quantity of item in hand.

2.3.7.5 Inflation price method

Under this method, closing stock is valued at a price higher than actual cost to provide normal loss.

2.3.7.6 Higher In First Out (HIFO) Method

This method is based on the assumption that closing stock of items always remains at the minimum value. So lots of the higher cost of materials purchased or goods manufactured are exhausted first. As this method always under values the stock it is not popular. It is based in the monopoly products and cost plus product as well.

2.3.7.7 Market Price Method

Market price either is the replacement price or the realizable price. The replacement price is used in case of items that are held in stock for use in production while realizable price is used in respect of the items that are kept in stock for sale. This method of valuation of stock is followed when the market value is lower than the cost so that possible losses may be provided for. This method can also be successfully used for the valuation for obsolete items of stock for a long time (Jain and Narang: 1995:P2.70).

2.4 Just In Time Inventory

The management of inventory has become very sophisticated in recent years. In certain industries the production process lends itself to 'just in time' inventory control. As the name implies, the idea is that inventories are acquired and inserted in production at the exact times they are needed. This requires efficient purchasing, very reliable suppliers and efficient handling system. One thing that has made this possible is the advent of instant information through sophisticated computer networks (Vanhome: 1990:p450-451).

2.5 Review of Master's Degree Thesis

we have emphasized above on the review of text books only so attempt is also made to review the related studies conducted by different agencies, expert, scholars related with inventory management of manufacturing enterprises in Nepal.

Some studies have been made in the subject of inventory management but few studies are review in this chapter.

1. Amrit Kumar Sharma Gaire(2000) has conducted a research work on the topic of "*Inventory Management: a case study of Royal Drug Ltd.*"The main objectives of this study are identifying the problems underlying in the inventory management and control system of RDL. Other objectives of his studies are;

- To assess the types of inventory maintained in RDL
- To examine the techniques being employed to manage the inventory in RDL.

- To suggest proper inventory model to RDL bases on analysis.
- To find out inventory position of RDL.

2. Puspa Raj Baral has also made study regarding *"Inventory Management; A case study of Gandaki Noodles Pvt. Ltd."* The Main objectives of his study were to highlight the Co.'s policies and objectives, functions and activities regarding inventory management. Finally he came to know that the factory is following neither economic order quantity model in its purchasing decision nor ABC analyze in inventory management. (Baral-1994)

3. Mr Surendra Shrestha regarding *Inventroy Management of Gorkha Patra Corporation* has conducted a case study. His main objective is to find out the inventory position of the organization and to provide different suggestion regarding inventory management. He had conducted that Gkorkha Patra had not applied any sort of available inventory management techniques to manage the inventory .k In the Goptrapatra Corporation; it is difficult but not impossible to apply the inventory management techniques because of lack of certain data. (Shretha-1998)

4. Mr Lila Bahadur Dhital has conducted the research work on the topic of *"Inventory Management: A case study of Nepal Food Corporation"*. The main objectives of his study were to highlight the NEC's policies related variables like purchase, sales, sales food quota of NFC. The findings of Mr Dhital are under food grains purchasing the domestic purchase are more in fluctuated and greater than import. The

relationship between edible cereal production and requirement is negative. The total food grains quota is fluctuated in year after year because of production fluctuation in Nepalese Kingdom.(Dhital-2001)

5. Mrs Radha Kumari Balika has studied about the *Inventory Problems of Hetauda Cement Industry Limited* to find the present inventory position and problems in managing inventory. After his studies he revealed that there is no proper system for material purchase in the industry. And the price and quantity of collected materials are fluctuating from year. The company is not following EOQ model in purchasing decision. The investment in inventory stock of HCIL is in large amount. The value of inventory is increasing from year to year. (Bilika-2003)

6. Mr Soraj Rijal has conducted the research work on the topic of *"Inventory Management: A case study of Agriculture Input Corporation"*. His main objectives are to find present inventory position of AIC, to find out inventory management techniques used by AIC and to provide optimum suggestion regarding inventory management of AIC.(Rigal-2005)

7. Bishnu Pradhan has conducted a study on *Significant of Inventory Management of Nepalese Manufacturing Enterprises*. He had studies the ratio of inventories to total assets computed for selected non-financial Nepalese enterprises. One of the important findings was to invest on average, about 22percent of total assets in the form of inventories in 2005/06 by Nepalese enterprise indicates that

larger amount of money has be invested in the form of inventory. Hence, the inventory management has greater significance. (Pradhan-2006)

8. Saroj Sidgel has conducted the research work regarding "*Inventory Management of Agriculture Input Corpoantion*" stated that AIC is not using Scientific model of inventory management. Although they don't calculate EOQ for the supply of chemical fertilizer, they order lots of 1000 to 2000 M.ton. There is no evidence of taking discount by AIC. Lead-time is not calculated properly. Re order is also not fixed. Regarding buffer stock, although AIC have capacity of sufficient warehouse through out the country, it remains out of stock in season and overstock in out of season. AIC is not using ABC analysis also. (Sigdel-2007).

CHAPTER III

RESEARCH METHODOLOGY

In the previous chapter the introduction, related literatures were reviewed for the purpose of this study. In this chapter, the research methodology presents the plan, procedure and tools used to analyze and interpret the available data.

Research methodology is the way to solve systematically about the research problem. It is the process of aiming at the solution of problem through the planned and systematic dealing with collection, analysis & interpretation of fact and figures. The major objective of this study is to analyze the inventory management of J.K Soap& Chemicals Industries. This study tries to focus on how the ideal inventories of the soaps major raw materials could be maintained and how the procurement system could be economic and effective.

For the purpose of achieving the objectives, the following methodology has been adopted which includes research design, nature of data, data gathering procedure and presentation & analysis techniques.

3.1 Research Design

The research design is the plan structure and strategy for investigation of the facts in order to arrive at conclusion. The plan is the overall scheme of program of research. It includes and outlines of what the investigator will do from writing the hypothesis and their operational implications to the financial analysis of data. This research design is planned to obtain the answer of research question through analysis of data. Research is systematic search for knowledge. It applies scientific methods to the study of universe.

The research design of this study will be descriptive as well as analytical. This study is primarily based on secondary data but whatever necessary the primary data are also collected through interviews with officers and non-officers through personal interview.

3.2 Population and Sample

There are large numbers of manufacturing companies in Nepal but only one company J.K Soap Industries has been selected for this study purpose. Even though various raw materials are used for producing different types of soaps in this company but in data analysis only three materials are used for calculating EOQ and ROL.

3.3 Nature and Sources of Data

The sources of data for the study will be primary as well as secondary. Primary data were collected by conducting interview with the officers of company. The secondary data were collected from:

- Studying and analyzing the balance sheet
- Studying and analyzing available unpublished records
- Reports and financial statement of the factory

3.4 Data Gathering Procedure

Secondary data were directly collected from various sources mentioned above especially from official records of the company as well as published financial statements.

Primary data were collected with a view to support the information collected from various secondary sources. All the gathered data have been used according to need and requirement of this study.

3.5 Data Period Covered

The study covered the period of seven years i.e.2059/60 to 2065/66.

3.6 Analytical Tools

Collected information has been presented in suitable forms like graphs, tables, figures and charts. For the analysis of collected data various inventory management model have been used whenever necessary. The proposed inventory models are listed below:

a. Statistical tool (Trend analysis)

The trend lines describe the average relationship between the two series. In fact, there is no difference between the lines of the best fit and the regression lines. The term line of the best fit is generally used, when X- series related to time and Y- series related to the value of the variable. If both X and Y series are variables, the line of best fit is known as line of regression. The equation describing the regression lines is called regression equation.

$$Y = a + bX$$

Where,

Y= the estimated value of Y for given value of X obtained from the line of regression of Y on X

a= Intercept or mean value of Y

b= Slope of trend lines/ rate of change

X= Time (in time series analysis)

$$a = \frac{\sum Y}{N}$$

$$b = \frac{\sum XY}{\sum X^2}$$

Where ,

a = Regression constant (Intercept)

b = Regression coefficient of change

Y = Total value of dependant variable

XY = Total value of the product of items in the two series

X^2 = Total value of the sum of the times in X-series

Here, the trend analysis of purchase, sales, inventory, raw materials, work in process, finished goods and purchase of raw materials are calculated to find out the future trend by the help of past data.

b. Economic Order Quantity

The economic order quantity may be defined as that level of inventory order that minimized the total cost associated with inventory management. EOQ can be determined by following way:

I. Formula Method

II. Table Method

III. Graphic Method

c. Re-order Level

The re-order level is defined as the level of inventory at which an order should be placed for replenishing the current stock of inventory and it should be appropriate so the cost associated with the inventory will be minimum.

CHAPTER IV

PRESENTATION AND ANALYSIS OF DATA

The basic objective of this study is to analyze the present practice of inventory management system in J.K Soap & Chemicals Industries. To achieve the said objective, collected data and information are analyzed in this chapter by applying inventory management tools and techniques.

4.1 Purchasing Procedure Practice in J. K Soap Inds.

Purchasing is the first important function of inventory management. So it requires different types of raw material such as palm acid oil, palm fatty oil, soap stone powder, salt, caustic soda and soap color for the production of different types of soaps.

J.K Soap & Chemicals Inds. needs regular supply of different types of raw material for the continuous production operation. Required raw materials for the factory are purchased by using following purchasing procedures.

4.1.1 Collection of Requisition

Purchasing manager of the company collects the purchase requisition slip from the store department for all items of regular use.

4.1.2 Decision for Purchase

On the receipt of the purchase requisition, the purchase department decide what & how much to buy?

The level of purchasing raw material directly affects the investment on inventory & cost associated with inventory which ultimately affects the profitability rate of the company. So the company should determine appropriate purchase quantity of raw material to

minimize the investment on inventory & cost associated with it. To cope with this situation company may apply the EOQ model to determine the appropriate purchase quantity of material. But in J. K Soap EOQ model of inventory management is not in practice.

4.1.3 Selection of Suppliers

Required raw materials for the company are not locally available so the company has to import most of the raw materials from India, China, Malaysia and Australia. For the selection of supplier, company should invite bids or tenders from listed suppliers and on the studying the terms of supply and the quality, quantity and price of goods supplier should be selected out of bidders or tenderizers. But sometimes company has imported required material directly from a registered supplier without inviting bids or tender by opening L. C.

4.1.4 Purchase order

After selecting supplier, a purchase order is prepared by the purchase department and sent to the vendor authorizing him to supply a specified quality and quantity of materials at the stipulated terms, time and place mentioned in it.

4.1.5 Receiving and inspecting materials

When materials are arrived they are received and checked by receiving clerk against the order placed by the purchasing department to vendor. After proper checking materials are delivered into the store departments. On checking if any discrepancy is found as regards to quality and quantity, it is immediately referred to the purchasing department to adjust the discrepancy. But sometimes, the purchasing

department has not tried to adjust the discrepancy as regarding to quality and quantity.

4.2 Store Control Device Practice in J. K Soap Industries.

Store keeping function includes the function of keeping the materials in the store and keeping their movements. The cost of materials holding in the store directly affects the total cost associated with holding inventories. To minimize the cost of holding material in the store all company use different types of controlling devices like bin cards, store ledger and ABC analysis technique.

4.2.1 Bin cards

J. K Soap & chemicals Inds. is using the bin cards in the form of loose sheets to keep the complete records of the receipt and issues of each item of material in terms of quantity as well as balance quality. In the loose sheet each item of stores, minimum level, re-order level, re-order quantity are applied. So by seeing the loose sheet, the store keeper can send the material requisition for the purchase of material in time. Appendix 1 shows the sample of bin cards used in J.K Soap and Chemicals Inds.

4.2.2 Store ledger

The company is maintaining store ledger to keep the complete record of each item of material purchase, issues and balance in term of quantity as well as in term of value. Appendix 2 shows a sample of store ledger used in J.K Soap and Chemicals Inds.

4.2.3 ABC Analysis

Selective inventory technique (ABC Analysis) is common for all to control inventories in the store. It classifies the material in the store to three groups so that effective control over the materials can be exercised. But the J. K Soap & Chemicals Inds. Has not classified the material in different groups for control purpose. It is seen that company has given equal attention to high value as well as less value and non critical materials. This attitude leads to increase the holding cost of inventory and investment on inventory.

The reason for not applying ABC Analysis to control the inventory in store may be due to the management is unknown about its advantages. If the company wants to minimize the holding cost of inventory and investment on inventory, the company should use ABC analysis techniques.

4.3 Issuing material

Materials should be issued against materials requisition slip. The pricing of the issues can be determined on the basis of cost price or market price. In case of J. K Soap & Chemicals Inds. inventory of different stock is valued at cost price.

4.4.Trend Analysis

Trend analysis was made in order to analyze the growth rate of various aspects of related to inventory management. This was basically done with the help of past data and used to forecast the future. Different aspects of inventory management for which trend analysis were made as presented below.

4.4.1 Trend analysis of purchase

Purchase is the process of acquiring something necessary to run the company. Purchase includes the acquisition of essential inputs as well as other stationeries and goods for the efficient functioning of management.

Table 4.1

Trend analysis of purchase

Fiscal year(X)	Purchase (Y) (in million Rs)	Trend value $Y = a + bX$
2059/60	130.31	127.62
2060/61	158.32	131.78
2061/62	85.28	135.94
2062/63	160.23	140.10
2063/64	140.14	144.26
2064/65	150.23	148.42
2065/66	156.21	152.58

Source: Annual Reports

Figure 4.1

Trend analysis of Actual purchase

Trend values for the study period show the steady increase of actual purchase throughout the period. But actual value of purchase was deviated from the trend value. Huge gap between the trend value and actual value was recorded in year 2061/62. Interestingly trend value and actual values were closer for each alternate year of 2059/60, 2064/65 and 2065/66.

4.4.2 Trend analysis of sales

Ultimate goal of any manufacturing industry is to produce the product and make it available in market for sale. Thus, sales are always associated with the manufacturing industries, which ensure the inflow of money to industry.

Table 4.2

Trent analysis of sales

Fiscal year(X)	Sales(in million Rs)	Trend value
2059/60	128.79	132.17
2060/61	148.39	136.69
2061/62	117.78	141.21
2062/63	158.80	145.73
2063/64	155.88	150.25
2064/65	160.22	154.77
2065/66	150.21	159.88

Source: Annual Reports

Figure 4.2

Trent analysis of Sales

The table above shows the picture of actual sales and trend value of sales. Sales had increased from 128.79 for the year 2059/60 to 160.22 for the year 2064/65 and decrease to 150.21 in year 2065/66. Trend value is increased steady during the periods 132.17 in 059/60 to 159.88 in the year 065/66.

4.4.3 Trend analysis of inventory

Inventory is all the possession of industry. Inventory constitutes the important part of current assets. Thus, the shortage of required inventory may result into irregular production, high manufacturing cost, unfavorable labor variation. Therefore, the inventory must be in optimum position.

Table 4.3
Trend analysis of inventory

Fiscal year (X)	Inventory(in million Rs)	Trend value
2059/60	7.85	8.25
2060/61	7.10	9.03
2061/62	12.28	9.79
2062/63	10.09	10.57
2063/64	12.87	11.34
2064/65	12.57	12.11
2065/66	11.21	12.88

Source: Annual reports

Figure 4.3

Trend analysis of Inventory

The table and figure above shows the trend value and actual value of inventory for the study period. Inventory of J. K soap had been increased from 7.85 million during 2059/60, 12.57 during 2064/65 and decrease to 11.21 in 2065/66 signifying the increasing trend.

4.5 Trend analysis of finished goods

Trend analysis of finished goods reflects the trend of production of the company.

Table 4.4

Trend analysis of finished goods

Fiscal year(X)	Finished goods(in millionRs)	Trend value
2059/60	1.94	1.56
2060/61	1.12	1.58
2061/62	2.19	1.60
2062/63	1.13	1.63
2063/64	1.37	1.65
2064/65	1.57	1.67
2065/66	2.12	1.69

Source: Annual reports

Figure 4.4

Trend analysis of Finished Goods

The table and figure above presents the actual value of finished goods was found increasing for the year 2059/60,061/62, and 2065/66 and decreasing for the year 2060/61,2062/63,2063/64 and 2064/65. But the trend value is slightly increasing from beginning to end of the period.

4.5.1 Inventory Management Analysis

A) ECONOMIC ORDER QUANTITY

Palm Acid Oil

Annual requirement = 1890000kg

Material cost = $1890000 \times 28 = \text{Rs}52920000$

Ordering cost per order

1. L/C charge =Rs 4100

2. Bank charge	=Rs1600
3. Clerical staff	=Rs29000
4. Transportation cost	=Rs105300
Total	= Rs 140000

Carrying cost

1. Insurance	=Rs117000
2. Storage cost	=Rs391695
3. Spoilage	=Rs28000
4. Interest on capital	=Rs150000
Total	= Rs686695

$$\text{Carrying cost per kg} = \frac{Rs686695}{1890000} = Rs 0.36 \text{ per kg}$$

1) Calculation of EOQ (Formula method)

$$EOQ = \sqrt{\frac{2RO}{C}}$$

Where,

EOQ = Economic order quantity

R = Annual requirement

O = Ordering cost per order

C = Carrying cost per kg

By fitting above mention data in EOQ formula

$$EOQ = \sqrt{\frac{2 \times 1890000 \times 140000}{0.36}} = 1212435.57 \text{ kg}$$

$$\begin{aligned} \text{No. of order} &= \frac{\text{Annual requirement}}{EOQ} \\ &= \frac{1890000}{1212435.57} = 1.56 \text{ times} \end{aligned}$$

i.e. two times in a year.

The above calculation shows that the economic order size should be 1212435kg where the combination of carrying cost and ordering cost

are minimum. So, if the company wants to minimize the inventory cost the company should place an order of 1212435kg at a time or place two orders in a year.

2) Calculation of EOQ (Table method)

Table 4.5

Showing order size, average inventory, ordering cost, carrying cost and total cost

No. of order	1	2	3	4	5
Order size(kg)	1890000	945000	630000	472500	378000
Average inventory	945000	472500	315000	236250	189000
Ordering cost(Rs)	140000	280000	420000	560000	700000
Carrying cost(Rs)	340200	170100	113400	85050	68040
Total cost(Rs)	480200	450100	533400	645050	768040

Where,

Order size= Total requirement/No. of order

Average inventory= Order size/2

Ordering cost= Total cost of an order ×no. of order

Carrying cost = Carrying cost per kg × no. of order

The above table shows that the carrying cost, ordering cost and total inventory cost of respective order size and no. of order. According to table, if the company placed only one no. of order in a year for 1890000kg of palm acid oil, the ordering cost, carrying cost and total inventory cost will be Rs 140000, Rs340200 and Rs480200 respectively. If the company placed 2 no. of order in a year for 1890000kg of palm acid oil by splitting two equal halves, the ordering cost, carrying cost and

total inventory cost will be Rs280000, Rs170100 and Rs450100 respectively. If the company placed 3 no. of orders in a year for 1890000kg palm acid oil the ordering cost, carrying cost and total inventory cost will be Rs420000, Rs113400 and Rs533400 respectively. If the company placed 4 numbers of orders in a year for 1890000kg palm acid oil the ordering cost, carrying cost and total cost will be Rs560000, Rs85050 and Rs645050 respectively. If the company placed 5 numbers of order in a year for 1890000kg palm acid oil by dividing into 5 equal halves the ordering cost, carrying cost and total cost will be Rs700000, Rs68040 and Rs768040 respectively.

From the above table, the ordering cost (Rs280000) and carrying cost (Rs170100) at 2 numbers of orders are nearly equal and it is the minimum cost of inventory (Rs450100). So the economic order quantity is 945000kg and order to be placed in a year is 2. If the company placed only 1 number of order in a year for 1890000kg palm acid oil, total cost will be (Rs140000+ Rs340200) Rs 480200 which is exceed by (Rs480200-Rs450100) Rs30100 than 2 numbers in a year. If the company placed 3 number of orders in a year for 1890000kg palm acid oil by dividing 3 equal halves, the total cost will be (Rs420000+Rs113400) Rs533400 which is exceed by (Rs533400-Rs450100) Rs83300 than 2 number of order in a year. If the company placed 4 numbers of orders in a year for 1890000kg palm acid oil by dividing 4 equal halves the total cost will be (Rs560000+Rs85050) Rs645050 which is exceed by (Rs645050-Rs450100) Rs194950 than 2 no. of order. Likewise, if the company placed 5 number of order in a year for 1890000kg palm acid oil by splitting into 5 equal halves, the total cost of inventory will be very much more than the total inventory cost of EOQ. So it is clear that if the company tends to minimize the inventory

cost and investment on inventory, the company should place 2 orders in a year i.e.945000kg at a time.

3) Calculation of EOQ (Graphic Method)

Y **Figure 4.5**

As we know that the total carrying cost increases as the order size increases because on an average a large inventory level will be maintained and ordering cost decreases with increase in order size because the large order size means less number of order. The behavior of total cost differs with order size. The total costs decline in the first stage and then they start rising when the decrease in ordering cost is more than offset by the increase in carrying cost. In figure carrying cost, ordering cost and total cost are plotted in vertical axis and order size in horizontal axis. The carrying cost line is gradually increases with the increase in order size and ordering cost line gradually decreases with the increase in order size. These two cost lines intersect at a certain point in the figure i.e. Q which is the minimum cost combination of inventory. In this point the total cost of inventory becomes minimum which is the respective order size. If the company increases or decreases the order size, the inventory cost will be higher.

B) REORDER LEVEL

Palm Acid Oil

Maximum usage rate = 5000kg/day

Maximum lead time = 42 days

Working days = 250days/year

Calculation of Reorder level (RL):

RL = Maximum usage rate × maximum lead time

$$= 5000 \times 42 = 210000\text{kg}$$

From the above calculation when the level of inventory reaches to 210000kg another new order should be placed. By the use of economic order quantity formula we have calculated the EOQ 945000kg and number of order to be placed 2 times in a year. So the new order for 945000kg palm acid oil should be placed after 125 days of the first order when the level of inventory reaches to 210000kg.

4) Annual requirement and annual purchase of palm acid oil in term of quantity (kg)

Table 4.5.1

Showing annual requirement and annual purchase of palm acid oil (kg)

Fiscal year	Annual requirement (AR)	Annual purchase (AP)	% Change (AP-AR)/AR×100
2059/60	1715000	1829000	6.65
2060/61	1793000	1907000	6.34
2061/62	1825000	1939000	6.25
2062/63	2164000	2258000	4.34
2063/64	1306000	1505000	15.24
2064/65	1903000	2052000	7.83
2065/66	2620000	2635000	5.73

Source: Annual reports

The above table shows the annual requirement and annual purchase made by the company on different years. Both annual requirement determined by the company and purchase made by the company is increasing and decreasing over the study period. If annual requirement of palm acid oil is compared with actual purchase made by the company, it is observed that the actual purchase always exceed the annual requirement of palm acid oil over the study. In F.Y 2059/60 annual purchase of palm acid oil exceed annual requirement by 6.65%, in 2060/61 it was 6.34%, in 2061/62 it was 6.25% and so on.

A) ECONOMIC ORDER QUANTITY

Palm Fatty Acid Oil

Annual requirement = 430000kg

Material cost = $430000 \times 33 =$ Rs 14190000

Ordering cost per order

1. L/C charge	= Rs4000
2. Bank charge	= Rs1500
3. Clerical charge	= Rs28000
4. Transportation cost	<u>= Rs86500</u>
Total	= Rs 120000

Carrying cost

1. Insurance	= Rs110000
2. Storage cost	= Rs350000
3. Spoilage	= Rs 16500
4. Interest on capital	<u>= Rs 90000</u>
Total	= Rs 566500

Carrying cost per kg = $\frac{Rs566500}{Rs430000} =$ Rs 1.32 per kg

1) Calculation of EOQ (Formula method)

$$EOQ = \sqrt{\frac{2RO}{C}}$$

Where,

EOQ = Economic order quantity

R = Annual requirement

O = Ordering cost per order

C = Carrying cost per kg

By fitting above mention data in EOQ formula

$$EOQ = \sqrt{\frac{2 \times 430000 \times 120000}{1.32}}$$
$$= 279610 \text{ kg}$$

a) Calculation of no. of order to be placed in a year

$$\text{No. of order} = \frac{\text{Annual requirement}}{EOQ}$$
$$= \frac{430000}{279610} = 1.54 \text{ times}$$

I.e. near about 2 times in a year.

From the above calculation, it shows that the economic order size should be 279610kg where the combination of carrying cost and ordering cost are minimum. So if the company wants to minimize the inventory cost the company should place an order of 279610kg at a time or place two orders in a year.

2) Calculation of EOQ (Table method)

Table 4.5.2

Showing order size, average inventory, ordering cost, carrying cost and total cost

No. of order	1	2	3	4	5
Order size(kg)	430000	215000	143333	107500	86000
Average inventory	215000	107500	71667	53750	43000
Ordering cost(Rs)	120000	240000	360000	480000	600000
Carrying cost(Rs)	283800	141900	94600	70950	56760
Total cost(Rs)	403800	381900	454600	550950	656760

Where,

$$\text{Order size} = \text{Total requirement} / \text{no. of order}$$

$$\text{Average inventory} = \text{Order size} / 2$$

$$\text{Ordering cost} = \text{Total cost of an order} \times \text{no. of order}$$

$$\text{Carrying cost} = \text{Carrying cost/ kg} \times \text{average inventory}$$

From the above table, it shows the carrying cost, ordering cost and total cost of respective order size and no. of order. According to the table if company placed only one no. of order for 430000kg palm fatty acid oil, the ordering cost, carrying cost and total cost will be Rs120000, Rs283800 and Rs403800 respectively. If the company placed 2 no. of order in a year for 430000kg palm fatty acid oil by splitting into two equal halves, the ordering cost, carrying cost and total cost will be Rs240000, Rs141900 and Rs381900 respectively. If company placed 3 no. of order for 430000kg palm fatty acid oil, the ordering cost, carrying cost and total cost will be Rs360000, Rs94600 and Rs454600 respectively. If the company placed 4 no. of order for 430000kg palm fatty acid oil, the ordering cost, carrying cost and total cost will be

Rs480000, Rs70950 and Rs550950 respectively. If the company placed 5 no. of order for 430000kg palm acid oil, the ordering cost, carrying cost and total cost will be Rs60000, Rs56760 and Rs656760 respectively.

From the above table 4.3 it is found that the relationship between two different costs is significantly opposite. The ordering cost increases/ decreases with the number of order and carrying cost increases/ decreases with the order size. When the no. of order increases the ordering cost increases but the carrying cost decreases and vice-versa. Whenever these two costs reaches nearly equal, the inventory cost will be the lowest and the respective order size will be the economic order quantity.

From the above table 4.3, the carrying cost and ordering cost at second no. of order are minimum cost of inventory i.e.Rs381900. So the economic order quantity is 215000kg and no. of order to be placed in a year is two. If the company placed only one order for 430000kg palm fatty acid oil the total cost will be Rs403800 which is exceed by (Rs 403800-Rs 381900) Rs21900 than the total cost of two orders in a year. If the company placed three no. of order for 430000kg palm fatty acid oil the total cost will be Rs454600 which is exceed by (Rs 454600- Rs 381900) Rs 72700 than the total cost of two no. of order in a year. If the company placed four no. of order in a year for 430000kg palm fatty acid oil by dividing into 4 equal quantities, the total cost will be Rs550950 which is exceed by (Rs550950-Rs 381900) Rs169050 than the total cost of two no. of order in a year. So it is clear that if the company tends to minimize the inventory cost, the company should place two orders in a year for 430000kg.

B) REORDER LEVEL

Palm Fatty Acid Oil

Maximum usage rate = 2150/ day

Maximum lead time = 30 days

Working days = 250 days/ year

Calculation of Reorder Level (RL):

RL = Maximum usage rate × maximum lead time

$$= 2150 \times 30 = 64500\text{kg}$$

From the above calculation when the level of inventory reaches to 64500kg another new order should be placed. By the use of EOQ table we have calculated the EOQ 215000kg and no of order to be placed 2 times in a year. So the new order for 215000kg palm fatty acid oil should be placed after 125 days of the first order when the level of inventory reaches to 64500kg.

Annual requirement and annual purchase of palm fatty acid oil in term of quantity (kg)

Table 4.5.3

Showing annual requirement and annual purchase of palm fatty acid oil (kg)

Fiscal year	Annual requirement (AR)	Annual purchase (AP)	% Change (AP-AR)/AR×100
2059/60	131000	145000	10.69
2060/61	133000	147500	10.90
2061/62	183000	197000	7.65
2062/63	256000	450000	75.78
2063/64	1090000	1199000	10
2064/65	788000	948900	20.42
2065/66	502000	526000	4.78

Source: Annual reports

The above table shows the annual requirement and annual purchase made by the company on different fiscal years. Both annual requirement determined by the company and purchase made by the company is increasing and decreasing over the study period. If annual requirement of palm fatty acid oil is compared with actual purchase made by the company, it is observed that the actual purchase always exceeded the annual requirement of palm fatty acid oil over the study. In F.Y 2059/60 annual purchase of palm fatty acid oil exceeded by 10.69%, in 2060/61 it was 10.90%, in 2061/62 it was 7.65% and so on.

A) ECONOMIC ORDER QUANTITY

Caustic soda

Annual requirement = 520000kg

Material cost (Qty× price) = 520000×31.06 = Rs 6151200

Ordering cost per order

- | | |
|------------------------|-------------------|
| 1. L/C charge | = Rs4025 |
| 2. Bank charge | = Rs1575 |
| 3. Clerical staff | = Rs28750 |
| 4. Transportation cost | = <u>Rs 95650</u> |
| Total | =Rs 130000 |

Carrying cost

- | | |
|------------------------|-------------------|
| 1. Insurance | = Rs 114000 |
| 2. Storage cost | = Rs31060 |
| 3. Spoilage | = Rs390000 |
| 4. Interest on capital | = <u>Rs100000</u> |
| Total | = Rs635060 |

Carrying cost per kg = $\frac{635060}{520000}$ = Rs 1.22 kg

1. Calculation of EOQ (Formula method)

$$EOQ = \sqrt{\frac{2RO}{C}}$$

Where,

EOQ = Economic Order Quantity

R = Annual requirement

O = Ordering cost / order

C = Carrying cost / kg

By fitting the above mention data in EOQ formula

$$\begin{aligned} EOQ &= \sqrt{\frac{2 \times 520000 \times 130000}{1.22}} \\ &= 332895.89 \text{ kg} \\ &\cong 332896 \text{ kg} \end{aligned}$$

a) Calculation of no. of order to be placed in a year

$$\begin{aligned} \text{No. of order} &= \frac{\text{Annual requirement}}{EOQ} \\ &= \frac{520000}{332896} = 1.56 \text{ times} \end{aligned}$$

i.e. near about 2 times in a year.

The above calculation shows that the economic quantity should be 332896kg where combination of carrying cost and ordering cost are minimum. So if the company needs to minimize the inventory cost the company should place an order of 332896 kg at a time or place two order in a year.

2) Calculation of EOQ (Table method)

Table 4.5.3

Showing order size, average inventory, ordering cost, carrying cost and total cost

No. of order	1	2	3	4	5
Order size (kg)	520000	260000	173333	130000	104000
Average inventory	260000	130000	86667	65000	52000
Ordering cost (Rs)	130000	260000	390000	520000	650000
Carrying cost (Rs)	317200	158600	105734	79300	63440
Total cost (Rs)	447200	418600	495734	599300	713440

Where,

Order size = Total requirement/ no. of order

Average inventory = Order size / 2

Ordering cost = Total cost of an order × no. of order

Carrying cost = Carrying cost / kg × average inventory

The above table VI shows the carrying cost, ordering cost and total cost of respective order size and no. of order. According to table, if the company placed only one no. of order in a year for 520000kg caustic soda, the ordering cost, carrying cost and total cost will be Rs130000, Rs317200 and Rs447200 respectively. If the company placed 2 no. of order in a year for 520000kg caustic soda by splitting into two equal halves, the ordering cost, carrying cost and total cost will be Rs 260000, Rs 158600 and Rs 418600 respectively. If the company placed 3 no. of order in a year for 520000kg caustic soda the ordering cost, carrying cost and total cost will be Rs390000, Rs105734 and Rs495734 respectively. If the company placed 4 no. of order in a year for 520000kg caustic soda the ordering cost, carrying cost and total cost will be Rs520000, Rs

79300 and Rs599300 respectively. If the company placed 5 no. of order in a year for 520000kg caustic soda by dividing into 5 equal halves the ordering cost, carrying cost and total cost will be Rs650000, Rs 63440 and Rs 713440 respectively.

From the above table 4.4, the ordering cost (Rs260000) and carrying cost (Rs158600) at 2 no. of order are nearly about equal and it is the minimum cost of inventory i.e. Rs 418600. So the economic order quantity is 260000kg and order to be placed in a year is 2. If the company placed only one no. order in a year for 520000kg caustic soda, the total cost will be (Rs130000+ Rs317200) Rs447200 which is exceeded by (Rs 447200- Rs 418600) Rs 28600 than 2 no. of order in a year. If the company placed 3 no. of order in a year for 520000kg caustic soda by dividing 3 equal halves, the total cost will be (Rs 390000+ Rs105734) Rs495734 which is exceeded by (Rs495734 – Rs418600) Rs 77134 than 2 no. of order in a year. If the company placed 4 no. of order in a year for 520000kg caustic soda by dividing 4 equal halves the total cost will be (Rs 520000+ Rs79300) Rs599300 which is exceeded by (Rs 599300- Rs418600) Rs180700 than 2 no. of order. Likewise, if the company placed 5 no. of order in a year for 520000kg caustic soda by splitting into 5 equal halves, the total cost of inventory will be very much more than the total inventory cost of EOQ. So it is cleared that if the company tends to minimize the inventory cost and investment on inventory, the company should place 2 orders in a year i.e. 260000kg at a time.

B) REORDER LEVEL

Caustic soda

Maximum usage rate = 2600kg/day

Maximum lead time = 36 days

Working days = 250 days / year

Calculation of Reorder Level (RL):

$$\begin{aligned} \text{RL} &= \text{Maximum usage rate} \times \text{maximum lead time} \\ &= 2600 \times 36 = 93600\text{kg} \end{aligned}$$

From the above calculation it is found that when the level of inventory reaches to 93600kg , another new order should be placed. By the use of EOQ table we have computed EOQ 260000kg and no. of order to be placed 2 times in a year. So the new order for 260000kg caustic soda should be placed after 125 days of the first order when the level of inventory reaches to 93600kg.

Annual requirement and annual purchase of caustic soda in term of quantity (kg)

Table 4.5.4

Showing annual requirement and annual purchase of caustic soda (kg)

Fiscal year	Annual requirement (AR)	Annual purchase (AP)	% Change (AP-AR)/AR×100
2059/60	533000	565450	6.09
2060/61	460000	555000	20.65
2061/62	537500	600000	11.63
2062/63	560000	655000	16.96
2063/64	498000	530450	6.52
2064/65	560000	600000	7.14
2065/66	530000	578000	9.05

Source: Annual Reports

The above table VII shows the annual requirement and annual purchase made by the company on different fiscal years. Both annual

requirement and determined by the company and purchase made by the company is increasing and decreasing over the study period. If annual requirement of caustic soda is compared with actual purchase made by the company it is observed that the actual purchase always exceeds the annual requirement over the study. In F.Y 2059/60 annual purchase of caustic soda exceeded annual requirement by 6.09%, in 2060/61 it was 20.65%, in 2061/62 it was 11.63%, and so on.

Major Findings From the Study

On the basis of data presentation and their financial and statistical analysis of J.K soap & chemicals Inds. Pvt. Ltd, the major findings related to this study are given below:

- I . Raw materials required are for the production of different types soaps are imported from foreign countries like Malaysia, China, Australia and India.
- II. Letter of credit is used to import raw materials from from foreign countries.
- III. The store control device adopted by J. K Soap is Bin card and store ledger. The company has not applied ABC analysis techniques to control various types of inventory in the store.
- IV. The company has not determined the Re-order level, maximum stock level and minimum stock level.
- V. There is not cost classification system so there is difficult to determine the ordering and carrying cost.
- VI. The company has not followed scientific inventory management technique i.e. Economic Order Quantity model for purchasing different types of raw material.
- VII. The company has purchased more raw material than the requirement.

VIII. The investment on inventory of J. K Soap is very large and the value of inventory is increasing year to year as compared to the production and sales.

IX. The company's purchase position for different types of raw materials is highly differing from year to year.

CHAPTER V

SUMMARY, CONCLUSION AND RECOMMENDATION

5.1 Summary

Organizational success basically depends on the systematic and scientific inventory management. It is impossible to achieve the goal of any enterprise without proper management of inventory. So it is one of the most important function of any organization to achieve its objectives.

J. K. Soap & Chemicals Inds. Pvt. Ltd. is a manufacturing company which was established on 24th Falgun 2054 under Company Act 2049. It supplies the quality product at right time in a reasonable price. To earn profit it is necessary to run the company efficiently, economically and profitably. To ensure this situation in J. K Soap Inds. The efficient management of inventory takes vital role. So this study is concerned with in what extent the company is applying the inventory management techniques to minimize the cost of inventory, which directly affect the price of product.

Most of manufacturing and trading companies invest a huge amount of money in the form of inventory. J.K Soap Inds. is being the manufacturing company invests huge amount of capital in form of inventory and cost of carrying inventory is higher out of total inventory cost. The cost of inventory directly affects the cost of production and profitability of company. It means slight reduction in cost of inventory decreases the production cost and ultimately increases the profitably at remarkable rate. For this, the efficient management of inventory is desirable.

This study is based on the inventory management of J. K Soap & Chemicals Inds. Pvt. Ltd. It is done with a view of solving the problem arises on achieving the objectives of the J. K Soap. Here the

main objective of the study is to analyze the inventory practices and to analyze the inventory management system followed by J. K Soap. To make this study, the related literatures have been reviewed. Review of literature gives the concept of inventory management and frameworks from various books, journals and articles.

The basic objective of the study is to examine the management of inventory in J. K Soap Inds. To fulfill the objective as described, appropriate research methodology has developed. It consists the research design, population and sample, nature and method of analysis. In order to carryout the study data have been basically collected from secondary sources such as annual report, official report and financial statement provided by J. K Soap Inds. The primary data is also collected from direct interview with concerned staffs of the company to find out the problem of company and then the collected data are tabulated and presented as the stated methodology. Then the analysis has been made using the descriptive analysis of inventory management and others analytical tools. This study covers only seven years of financial data i.e. from 2058/59 to 2064/65. It is also used the various inventory tools to analyze the available data.

Descriptive analysis consists of the purchase procedure practice in J. K Soap Inds, store control device practice and issuing materials. Inventory management analysis is done by the analysis of AR and AP. The company has poor estimation of AR. So the company should make the purchase budget. The company does not purchase the raw material based on the economic order quantity. So if company wants to minimize the inventory cost the company should use EOQ model. To find out the future trend, the trend analysis of purchase, sales, purchase of raw material, inventory, work in process and finished goods has been done.

5.2 Conclusion

The primary objective of this study is analyzing the inventory management practices of J.K Soap Inds. and problem faced by this company in the management of inventory. For the purpose of this study the data and the necessary information were collected from the records and annual reports provided by the company.

J. K Soap & Chemicals Inds. has applied only bin cards and store ledger as the inventory control techniques but not applied the ABC analysis. The company does not classify the inventory cost into carrying cost and ordering cost. The company does not follow the economic purchase order so the total cost of carrying and ordering inventory is higher. By the analysis, actual inventory cost is greater than the economic order size of inventory cost.

By making the overall study it can be concluded that J. K Soap Inds. Pvt. Ltd. should maintain the economic order size which helps to minimize the inventory cost and to increase the profit of the company.

5.3 Recommendation

To achieve the organizational goal of J.K. Soaps & Chemicals Pvt. Ltd. the efficient management is essential. The management of inventory in J.K. Soaps and Chemicals Pvt. Ltd. is needed for the betterment of the company. So it has to initiate the steps for appropriate management of inventory to attend its set objectives successfully. On the basis of the study, the following suggestions may be recommendations for consideration.

I. Purchase plan should be prepared for different types of raw materials by seeing production plan and with the proper

co-operation and co-ordination among purchasing, storing, marketing, sales and other concern departments to avoid the huge investment in the raw materials.

II. In purchasing procedure, purchase manager should maintain all the necessary records keeping in mind the most important objectives of the purchase department i.e. purchasing right quantity and quality of material at the cheapest rate at proper time to help smooth running of the production functions.

III. Once material received by the store, it is issued by the concerned department as per the quantity demanded in the requisition from previously provided to the store department.

IV. The scientific management technique should be applied by the company for purchasing different types of raw material so as to maintain optimum level of inventory and to minimize the total inventory cost.

V. Re-order, maximum level and minimum level for each types of materials should be maintained by the company to avoid the over stocking of materials.

VI. The selective inventory model (ABC analysis) should be applied by the company for the control of the inventories in the store. ABC analysis divides the inventory into three groups i.e. ABC according to their usage values helps to apply proper control for different group of inventory, minimize the investment of inventory and minimize the cost of storage.

- VII. Lower investment on inventories in relation to total assets may create immediate crisis in the side of production in short duration unfavorable circumstances. Therefore it is necessary to maintain the adequate level of investment on inventories.
- VIII. Specific policy on inventory should be defined and comprehensive system of inventory management has to be introduced.
- IX. The top level management should pay its attention to the overall management, purchasing, production and financial aspect of factory.
