RECOMMENDATION

This is to certify that the dissertation work entitled **Land Cover Classification and Forest Normalized Difference Vegetation Index (NDVI) Analysis of Manaslu Conservation Area, Central Nepal** submitted by **Mr. Janardan Mainali** has been carried out under our supervision. The entire work is primarily based on the results of his research work and has not been submitted for any other degree. We recommend this dissertation work to be accepted for the partial fulfillment of Master of Science in Botany.

Research Supervisor

Prof. Dr. Pramod Kumar Jha
Central Department of Botany
Tribhuvan University

.....

Associate Supervisor

Dr. Dinesh Raj Bhujju
Chief of Science Faculty
Nepal Academy of Science and Technology
Lalitpur, Nepal

APPROVAL LETTER

This dissertation work submitted by Mr. Janardan Mainali entitled "**Land Cover Classification and Forest Normalized Difference Vegetation Index (NDVI) Analysis of Manaslu Conservation Area, Central Nepal**" has been accepted as a partial fulfillment of M.Sc. in Botany.

EXPERT COMMITTEE

Research Supervisor

Prof. Dr. Pramod Kumar Jha

Tribhuvan University

Acknowledgements

It has been possible to bring this work in this shape with the generous support of my teachers and cooperation of my colleagues and family.

Firstly, I would like to express my sense of gratitude to my academic advisors Prof. Dr. Pramod Kumar Jha, Dr. John D. All and Dr. Dinesh Raj Bhujaraj for guiding me to carryout this work. I am also grateful to Prof. Dr. Krishna Kumar Shrestha, Head of Department for departmental support and Remote Sensing/GIS facilities. I would like to thank teachers Dr. Bharat Babu Shrestha, Dr. Chandra Pokhrel and Dr. Ram Kailash Yadav for help and suggestions during this work.

Help from different individuals have been instrumental during my thesis work. I am indebted to Dr. Narcisa Pricope, Mr. Kamal Humagain, Ms. Sunita Thapa and Ms. Rita Chhetri for their cooperation during the first field visits. Similarly I would like to thank Mr. Arbindra Shrestha, Mr. Narayan Gaire and Ms. Prabina Rana for their support in the second field visit.

Nepal Academy of Science and Technology (NAST) deserves plethora of thanks for providing me with the financial support for my second field visit.

My friends Mr. Mahesh Limbu, Mr. Khum B. Thapa Magar and Ms. Shova Baral are never forgotten for being always on my side whenever I needed them. I am thankful to Mr. Sarbagya Kafle for his suggestion in grammatical errors of the manuscript.

Waiting, I would like to thank my sister Chandika for her support during all the time. My parents and all family members, indeed, deserve special acknowledgements.

Abstract

Remote sensing is nowadays widely used in study and management of environment both in spatial and temporal scales. Land cover classification is one of the earliest applications of remote sensing. Remote sensing can also be used in understanding different ecological phenomenon. This work encompasses land cover classification and productivity (NDVI) analysis of five high mountain forests of Manaslu Conservation Area (MCA) of central Nepal using remote sensing and GIS. Normalized Difference Vegetation Index (NDVI) calculated from remote sensing image is an indicator of vegetation vigor, productivity and health. It is the simplest index to understand the vegetation performance in different scales.

Landsat ETM+ image is used to classify land cover. Unsupervised and supervised methodology was used for classification in ERDAS imagine software. Accuracy of classified map was assessed by confusion matrix. NDVI analyses of five different forest patches (*Betula-Abies*, *Larix*, *Pinus wallichiana*, *Quercus* and *Picea-Tsuga*) were done using MODIS terra data products. NDVI of each forest patches was acquired from 16 days composite 250 m MODIS data of year 2000 January to 2008 December. Relation between NDVI and total monthly precipitation and average temperature of nearest weather station (Gorkha) was also tested.

Land cover map is acquired with 60.14 percent of overall accuracy. Boulder & Grass occupies highest area in MCA followed by human influenced land cover Agriculture & Settlement. Among five forest examined *Picea-Tsuga* forest is found with highest NDVI followed by *Quercus* forest. *Betula Abies* forest of highest altitude is found with lowest average NDVI value. *Larix* and *Pinus wallichiana* forests lie in between them. Except maximum value of *Larix* no forest showed any trend of increasing or decreasing NDVI from 2000 to 2008. One month lag of average monthly temperature and two month cumulative rainfall has been found as best predictor of NDVI for most of the forest types. Temperature is linearly related to NDVI and is seen as limiting factor for productivity of high mountain forest. Precipitation, however is unimodally related to NDVI exhibiting highest NDVI in moderate rainfall.
