2007

LETTER OF RECOMMENDATION

The thesis entitled "**Use of a Loop-Mediated Isothermal Amplification (LAMP) for Direct Detection of *Mycobacterium In Sputum*** " has been completed by **Mr. Bal Ram Adhikari** under my supervision. I hereby recommended this thesis for examination by the Thesis committee as a partial fulfillment for the Degree of **Master of Science in Microbiology (Medical)**.

Dr. Prakash Ghimire, Ph.D.
Associate Professor
Central Department of
Microbiology
Tribhuvan University
Kirtipur, Kathmandu
Date.....

Dr. Basu Dev Pandey, Ph.D.
Senior Medical Officer
Sukra Raj Tropical and
Infectious Disease
Hospital Teku,

CERTIFICATE OF APPROVAL

On the recommendation of **Dr. Prakash Ghimire, Dr. Basudev pandey** and **Dr. Bhawana shrestha**, this dissertation of **Mr. Bal Ram Adhikari** is approved for the examination and is submitted to the Tribhuvan University in partial fulfillment of the requirements for **Master of Science degree in Microbiology (Medical)**.

Dr. Anjana Singh, Ph.D.
Head
Central Department of Microbiology

ACKNOWLEDGMENT

I would like to express my great debt of gratitude to my respected supervisor Dr. Prakash Ghimire, Associate Professor, Central Department of Microbiology, Tribhuvan University Kirtipur for his continuous inspiration, full support and expert guidance.

I would like to express my deep sense of gratitude to my respected supervisors Dr. Basudev pandey, Senior Medical Officer, Sukraraj Tropical Hospital, Teku. and Dr. Bhawana shrestha, Project Chief, German-Nepal Tuberculosis Project(GENETUP), for their constant inspiration and valuable suggestions during the entire period of my dissertation work.

I want to express my thankful to all of the patients, who were included in my research, without whose co-operation I never complete my research work. I am eternally grateful to them and wish to get well soon.

I am thankful to Associate professor Dr. Anjana singh, Head of Department, Central Department of Microbiology, Kirtipur, Kathmandu. I am equally thankful to Prof. Dr. Shital Raj Basnyat, Asso. Prof. Shreekant Adhikari, Asso. Prof. Dwej Raj Bhatta, Assistant Professor Mrs Saila Basnyat, Assistant Professor Mr Binod Lekhak and all the respected teachers and staffs of Central Department of Microbiology for their full fledge support.

My deep sense of gratitude extends to Dr. Bishnu Acharya, Everest International and Research Center, for his inspiration and valuable comment during working period in the laboratory.

I am very much grateful to Mr. Bhagawan Maharjan, lab incharge, GENETUP, for his help during sample collection and over all lab performance. I am also thankful to Mr. Suraj Shrestha, Mr. Sujit Maharjan , Mrs Meera Shrestha and all other staffs of German-Nepal Tuberculosis Project (GENETUP), for their kindness and help during my research work.

I would also like to express my sincere gratitude to Prof. Dr. Suzuki, Dr. Yoda and all Japanese team for their supplies of LAMP reagents as well as technical assistance.

I would like to acknowledge to all of my colleagues Nirajan Bhattarai, Manita Guraguin, Dhan K. Pant Rup Bahadur Kunwar, Madan S. Bohara, Khagendra K.C. for their valuable suggestions and help to complete my research work.

I extend my thanks to Ms Binita Koirala and Mr. Shant Raj Khanal for their help during study period.

Finally, I would like to express my deepest gratitude to my parents, brother and sister for their blessing, understanding and encouragement to complete this work.

Date:

Bal Ram Adhikari

ABSTRACT

Most first line anti-tuberculosis drugs have less invitro activity against *M. avium*, *M. intracellulare* and *M. kansasii*. Therefore rapid species identification and proper use of drugs are key requirements for the effective treatment and case management of tuberculosis as well as *Mycobacterium avium* complex-pulmonary disease (MAC-PD) and *Mycobacterium kansasii*-pulmonary disease (MK-PD). The development and evaluation of new diagnostic technique, which can diagnose causative agent in simple and rapid way, is the necessity of this century. Loop-Mediated Isothermal Amplification (LAMP) provides new possibilities of above requirements for direct detection of *M. tuberculosis*, *M. avium* complex and *M. kansasii* in sputum samples.

This study was carried out from October 2005 to September 2006. A total of 190 (129 from 43 new suspected pulmonary tuberculosis patients and 61 from 61 follow up patients) sputum samples were included in this study. All these samples were further processed for flurochrome staining but only 130(69 from new suspected pulmonary tuberculosis patients and 61 from follow up patients) sputum specimens were subjected to culture and LAMP. Thus 130 sputum specimens were included in this study to compare them with microscopy, culture and LAMP. Among them 50(38.46%) were found to be positive by flurochrome staining, culture and LAMP. Similarly 48(36.92%) samples were negative by all diagnostic methods. 1(0.77%) microscopy and culture positive sample was negative by LAMP. Similarly 3(2.31%) microscopy and LAMP positive cases were negative by culture. 3(2.31%) culture positive cases were negative by both Microscopy and LAMP. 8(6.16%) culture negative cases were positive by LAMP where as 17(13.07%) Microscopy negative samples were positive by culture and LAMP.

Out of 78(100%) total LAMP positive cases, 76(97.44%) were positive with *M. tuberculosis* primer and remaining 2(2.56%) were positive with *M. intracellulare* primer. None of the *M. avium* and *M. kansasii* cases were found from the samples that were included in this study.

While comparing the LAMP results with gold standard culture, the sensitivity, specificity, predictive value of positive test, predictive value of negative test, percentage of false negative and percentage of false positive of LAMP were found to be 94.36%, 81.36%, 85.90%, 92.31%, 5.63% and 18.64% respectively. Similarly, LAMP had sensitivity 98.14% and specificity 67.11% while compare with microscopy.

Therefore, LAMP is sensitive and specific molecular technique, which can be used effectively for the diagnosis of clinically, microscopically, and culturally confusing cases thus facilitating the effective treatment and case management of tuberculosis and other atypical mycobacterial infection. Due to its easy operation and rapid amplification efficiency, it can be used in well-equipped laboratories for clinical use if sample preparation, nucleic acid extraction and cross-contamination controls are addressed.

Key words: *M. tuberculosis*, *M avium* complex, *M. kansasii*, LAMP, TB, MAC-PD, MK-PD, Sputum
