The Master of Philosophy in Education
(2009)

Abstract

The cooperative learning paradigm has been figure out as an umbrella method of all other methods. It has itself many methods but each and every one has been found to be dedicated to make the learning creative, joyful, socialized, team working and meaningful based on the potentiality of prior knowledge of the students as their cultural capital. As the method runs through social activity and teamwork, it seeks the true and direct participation of the learners with their own head and soul. It has mainly been spinning on the three theories; psychology of building knowledge through mental exercise/action of Piaget, Lave and Vygotsky's anthropological perspective of learning through scaffolding and Dewey's philosophy of truth is subjective.

In this closure, the study was undertaken with the purpose of digging out the effectiveness of cooperative learning approach through the 'friendship group' formation in terms of immediate learning, withholding and ultimately the net gain in learning. In the mean time, it was tried to find out the problems being faced by the teachers while adopting cooperative learning system, self-regulation of the students and relevancy of this approach in Nepalese classroom situation. To ease my study, I had further formulated the principal research questions into other components as well. The basic framework of the theoretical closure was made to lay on the foundation of epistemology, ontology and axiology of the cooperative learning paradigm. In this study, the review of literature has covered the general overview of different types of related literatures to frame up the study with specific ingredients and some theoretical closures that to link the issues raised herewith.

As I was basically concerned with the perception, participation and output of the learning of the students based on their cultural and social property, I adopted the qualitative research method along with the quantitative one. The research method used was non-equivalent control group of quasi-experimental design. The study was done by taking sample of size 74 students comprised of control and experimental groups from two schools of Kathmandu valley. The major tools of qualitative method were observation of classrooms with checklist and interview of students, subject teachers, general teachers, head teachers, subject experts, supervisors and curriculum experts with interview guidelines. Similarly, the pretest, posttest and retention test were administered to collect the data for quantitative analysis. The quantitative data were analyzed with the help of

13.0 version of SPSS package whereas the qualitative data were properly arranged and triangulated with the theoretical closures and previous findings and then gave the final meaning to my findings. The major findings were the significant achievements of the students of experimental group, who were taught according to the cooperative learning phenomena with the help of cooperative teaching incidents through friendship groups. The achievements were taken into account of immediate learning, last longer memory, net gain and three cognitive domains. Similarly, the study has shown the self-esteemness of the students and relevancy of cooperative learning method with some modifications in Nepalese classroom set-ups. In this study, I also realized that the importance of learning environment which includes classroom set up, friendship groups, cultural and social capital, valuing and relating the pre-existed knowledge of students to achieve the mathematical knowledge and skills.

Acceptance and Recommendation

The undersigned certify that we have read, approved, and recommended to the Faculty of Education, Tribhuvan University for acceptance, a thesis entitled THE UPSHOTS OF MATHEMATICAL KNOWLEDGE AND SKILLS ACHIEVED IN FRIENDSHIP GROUPS THROUGH COOPERATIVE LEARNING PARADIGM by Mukunda Prakash Kshetree in partial fulfillment of the requirements for the degree of MASTER OF PHILOSOPHY IN EDUCATION WITH SPECIALIZATION IN DEVELOPMENT STUDIES.

Acknowledgement

I would like to express my sincere insightful gratitude to Prof. Dr. Hari Prasad Upadhyay, Central Department of Mathematics Education, Tribhuvan University, supervisor of this dissertation, who proffered me his level best scholarly guidance, continue back-up, friendly behavior and support which help me to overcome my doubts and mystifications in completing this study.

I am extremely indebted to Prof. Dr. Bidya Nath Koirala who meant a lot to me from every educational perspective and a great advisor beyond this research task even from the very beginning days of my M. Phil study. Without his extremely scholar dealing and motivation, I would not come to this position of accomplishing the dissertation. So, I am honestly gratifying to him ever for his prompt feedback, precise educational treatment, a roll model duty shown towards the M. Phil. Program and all the students along with me.

I am significantly thankful to my most honored both the senior educators Prof. Dr. Siddhi Prasad Koirala and Prof. Dr. Hira Bahadur Maharjan who are the real path finder of my educational carrier and development along with guiding me in this thesis whenever and wherever I needed them. I would also like to express the deepest appreciation to these great personalities in the form of external examiners for their constructive commentary.

I am deeply grateful to numerous people, subject experts, senior teachers, supervisors, curriculum experts along with all of my colleagues and classmates of M. Phil. study who have contributed substantially to the research works especially development and implementation of the various research tools, test items, teaching incidents and training program. I am intensely indebted to two sampled public schools for providing space, students, time and allowing me for the conduction of field level research works. Similarly, I would like to thanks to a highly reputed private school for letting me to observe their classrooms and school with our teachers. The teachers especially, S. P. Ghimire, P. Nepal, R. Joshi, T. B. Rana and R. Dhakal along with their students who wholeheartedly offered their support during this undertaking, have profoundly deserved my heartfelt appreciation.

I would definitely like to express brutally thanks to Pramila, Pramoon and Prasidda who directly or indirectly provided me handy and cooperative assistance, encouragement and moral support during this period of several months in which this endeavor consolidated, without their care and consideration, this thesis would likely not have full-fledged to this scope.
